

H₂OW low

...can you go?

Veronica Cruz, Nico Cserepy, Jane E, Matthew Leong

Overview

1. Problem & Solution
2. Contextual Inquiry
 - a. Description
 - b. Result
3. Task Analysis
4. 3 Representative Tasks
5. 3 Application Ideas
6. Summary

The Problem

Can you read this...?

The solution lies in

H₂O^W low !

Contextual Inquiry Description

- How do people use water?
- Are they interested in conservation?
 - If so, are they engaged in it?
 - What motivates/discourages them?
- How much do they know about their water usage?

Who we recruited

- Students
 - They are our primary target group!
- Recruited on campus/graduate residence.

Tasks

Contextual Inquiry Results

- “I am not above the average!”
- Can’t quantify water use.
 - response: “5 gallons for a shower”
- Anonymous consumption/lack of accountability.

Task Analysis

- Who will use the system?
 - Groups such as students / families / work colleagues
- What tasks do they perform?
 - Evaluate their personal water consumption
- What tasks are desired?
 - Sustainable use

Task Analysis

- How are tasks learned?
 - Competition / constant reinforcement
- Where are the tasks performed?
 - Hopefully everywhere!
- Relationship between customer & data?
 - Currently 0! e.g 5 gallons / shower
 - Water bill (0.0025\$/gallon)

Task Analysis

- What other tools do customers have?
 - Manual entry
 - Requires active checking
 - No incentives
- How do users communicate w each other
 - Currently THEY DON'T!
 - Live competitive tracking / chat function

Task Analysis

- How often are tasks performed?
 - Multiple times daily
- What are the time constraints?
 - Until the event finishes
- What happens when things go wrong?
 - Lose competition
 - Global drought, sad times

3 Representative Tasks

- simple:
 - automatically import water usage data
- moderate:
 - make conservation a competition
- complex:
 - allow cities to collect data about population water usage patterns

3 Application Ideas

- Competition

- Significance: medium (less long term)
- Feasibility: high (easy to do between dorms)
- Interest: high (students are competitive, possibly prize incentives)

3 Application Ideas

- Charity

- Significance: high (helps people in need)
- Feasibility: medium (deals with charities)
- Interest: high (support good cause)

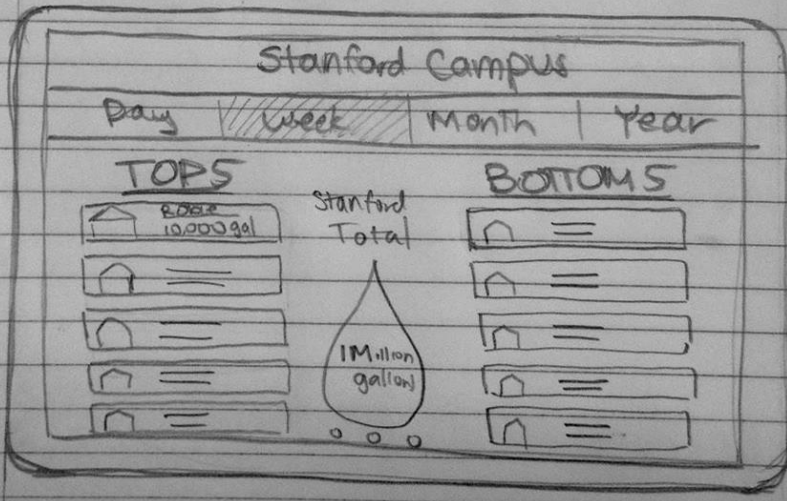

3 Application Ideas

- Education

- Significance: high (true goal is long term behavioral change)
- Feasibility: high (regular factlets pop up)
- Interest: low (requires regular checking)

Our top choice

- Combats the two problems uncovered through contextual inquiry:
 - lack of accountability
 - no motivation
- Makes data collection painless and automatic
 - comprehensive, integrated in the home, easy

Summary

- Comprehensive in-residence system
- Automatically tracks water use
- Set personal and residence goals
- Compare performance to others!

“Moisture is the essence of wetness, and wetness is the essence of beauty.” - Derek Zoolander
