Rechords

HI FI PROTOTYPE README

Jourdann Fraser • Vy Mai • Tiffany Manuel

Our prototype was built using React Native and Expo. Due to difficulties ejecting from Expo, we have included our code in a .zip file on our website instead. To use our app, please use the following instructions:

- Download the .zip file from our [website](#).
- Run `npm install` in terminal
- Run `expo start` in terminal
- Choose one of the following options:
    - [Easiest] Download **Expo** from the app store and scan the QR code
    - Run on ios simulator (for Macs)
    - Run on Android device/emulator (for Windows or Macs)

LIMITATIONS

Despite being a hi-fi prototype, we were unable to implement all functionality. Due to time constraints, we have omitted the following:

- Detecting a song with Spotify API or music recognition software
- Adding a message when sending a rechord to a friend
- Expanding use of Google Maps API to search for a location
- Updating the Explore page based on user search history
- Implementing functionality for deleting a friend rechord
- Implementing sort by/favoriting functionality
- Moving the rechord cover up when editing the description
