# Overview of Problem/Solution

## PROBLEM

Visually impaired screen reader users are frustrated with the lack of focus, context, and emotion in auto-generated alt-text captions on social media platforms.

Our interviewees repeatedly asserted a desire for more context-filled, human-generated alt-text.

## SOLUTION

Our solution promotes alt-text generation from a behind-the-scenes computation to user-facing, context-providing process that prompts sighted users to modify AI-generated alt-text on their own images before posting.

Various game-like incentives will be incorporated to encourage sighted users to not only adopt alt text into their own images, but also motivate others to do the same.

# 1. Finding where to put alt text

simple task

# 2. Modifying auto-generated alt text suggestions

medium task

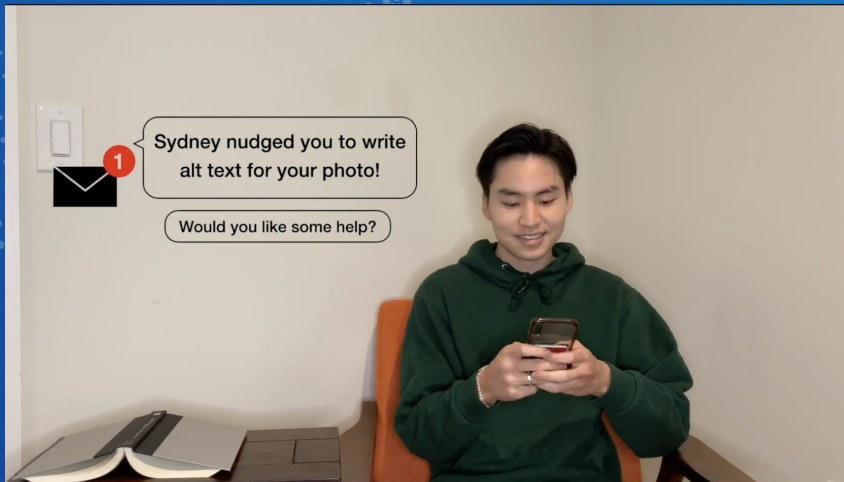

# 3. Identifying inaccessible images and nudging friends to write alt text

complex task

1. Finding where to put alt text

2. Modifying auto-generated alt text suggestions

3. Identifying inaccessible images and nudging friends to write alt text
