# CircLing

*A way to preserve, keep track of, and share your language using your day-to-day conversations with your family & friends circle.*

# Problem & Solution Overview

After meeting a Latina cashier at EVGR, we identified the problem that many first- / second-generation people mostly **maintain** their native language **via older** family members.

Our solution is to eternalize that **language connection** between the user and their family & friends via their 'language footprint' made of **texts and calls**, and provide **data insight** on each user's language use, thereby assisting the user to **preserve** their multilingualism.

# Outline

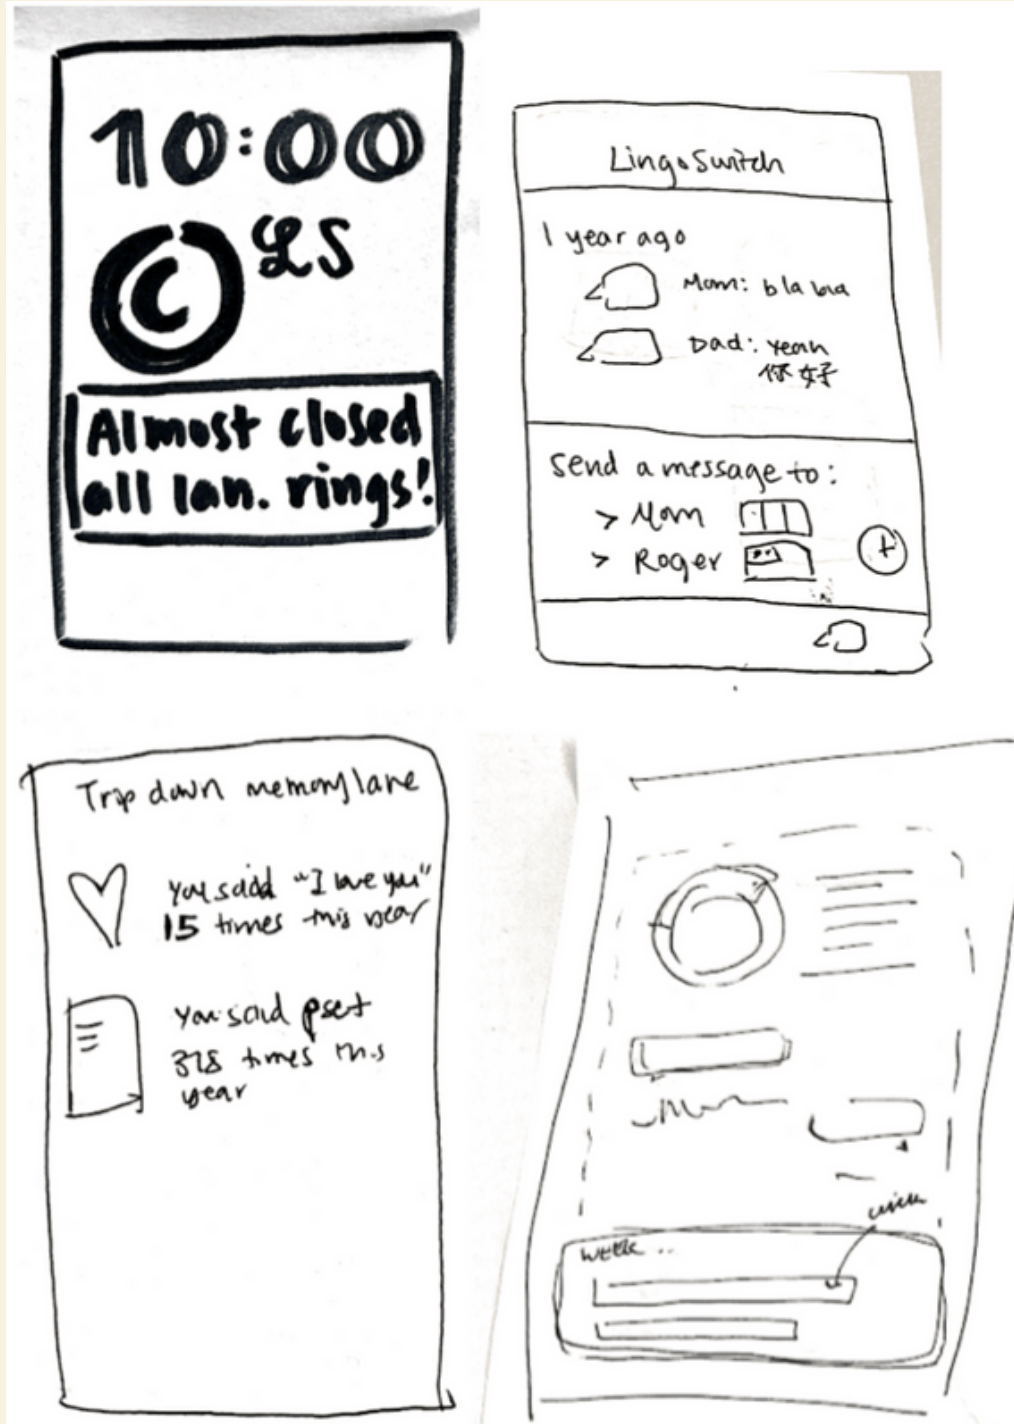

- Sketching Exploration
- Deeper Dive into Mobile and XR
- Lo-Fi Prototype & Task Flows
- Testing
- Results and Discussion

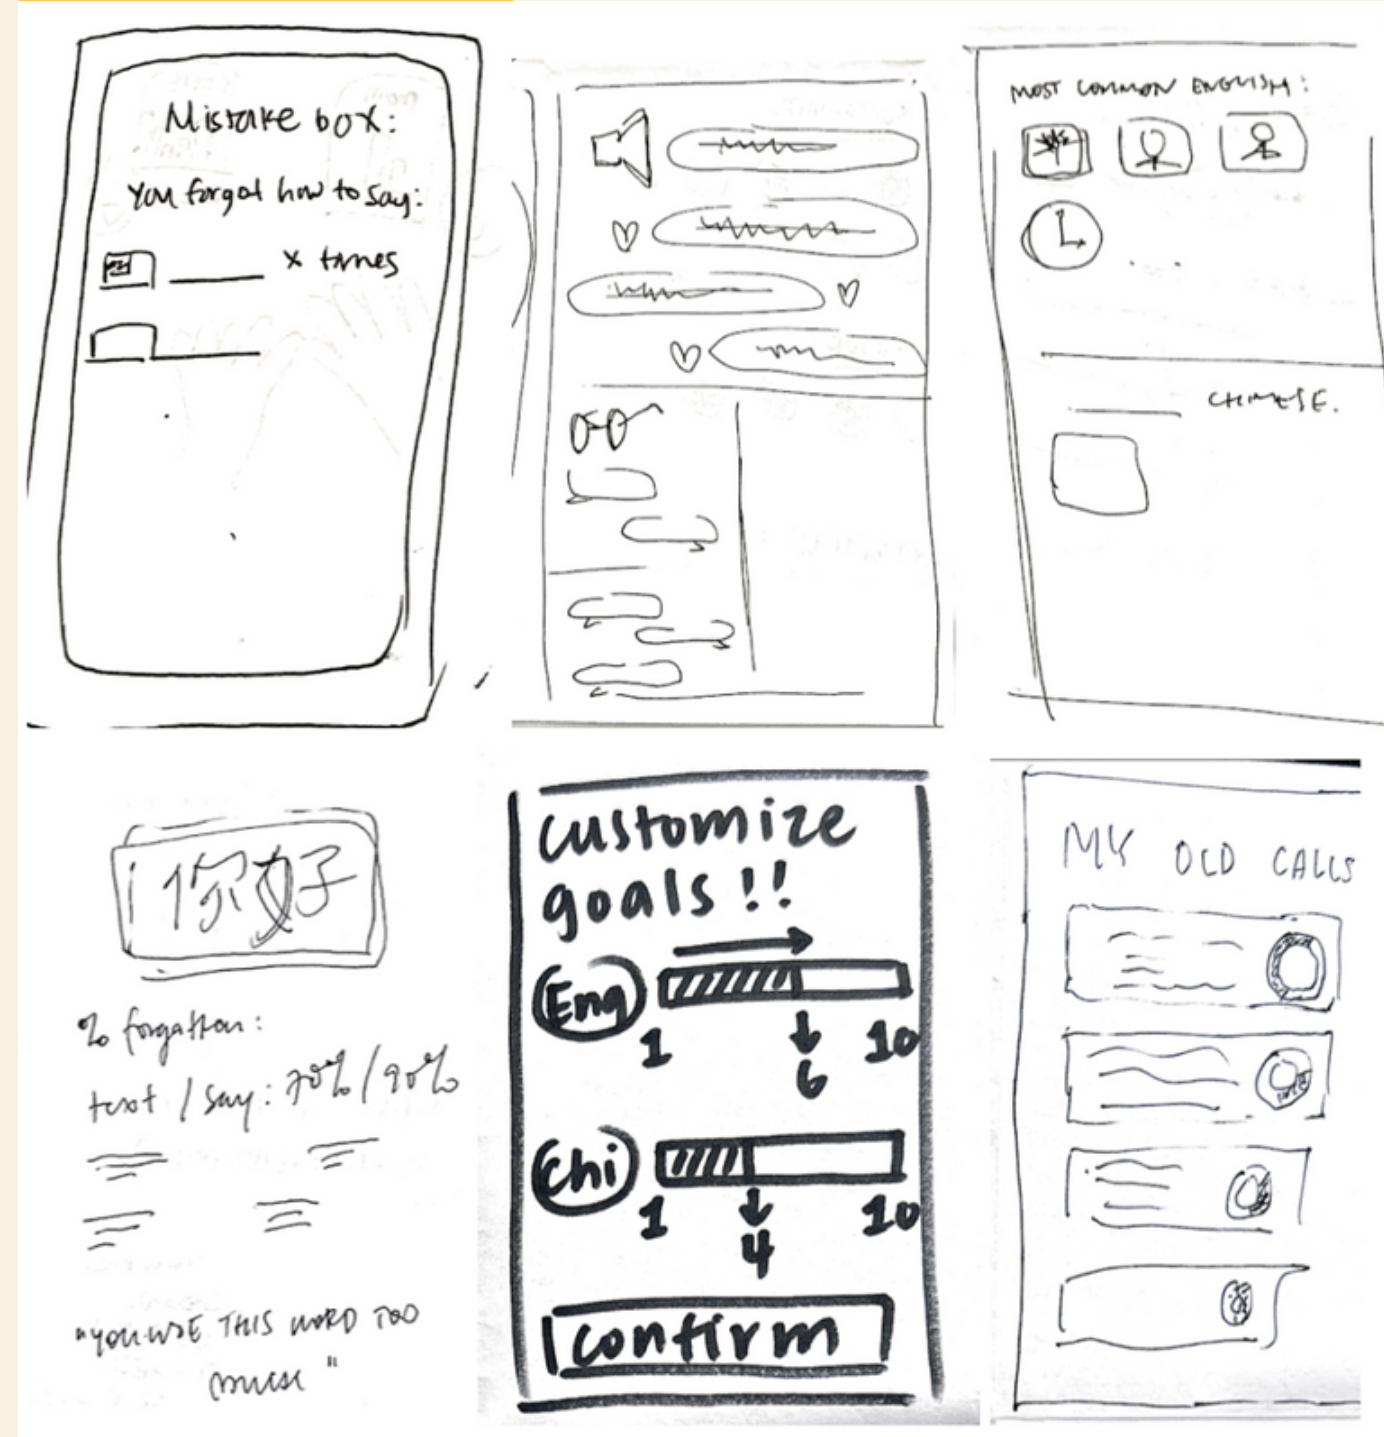

# Sketching explorations

## Notification-based

## Mobile UI

## VR

# Sketching explorations

AR

Wearable

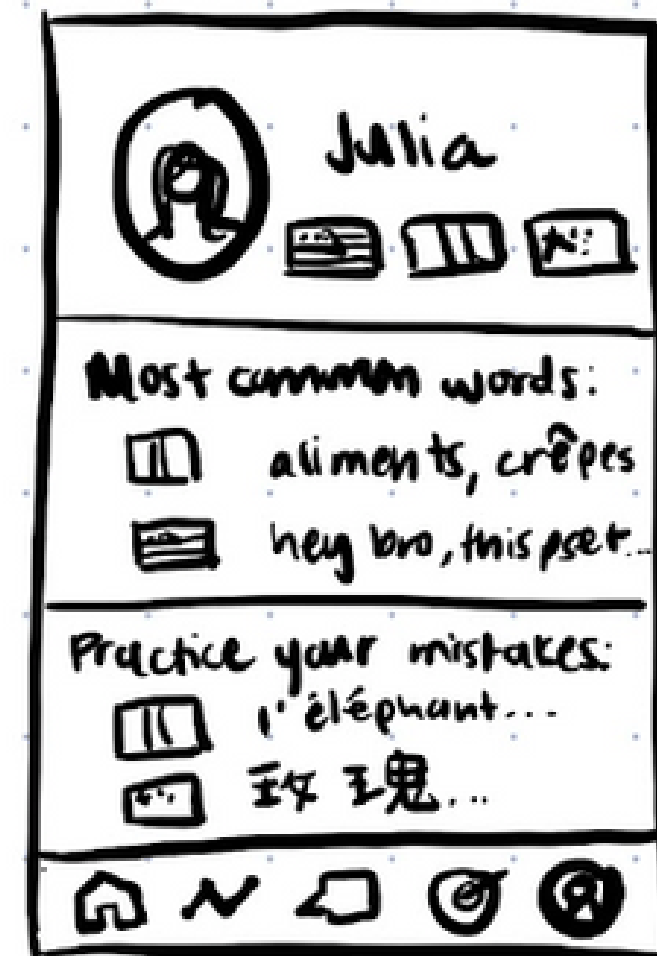

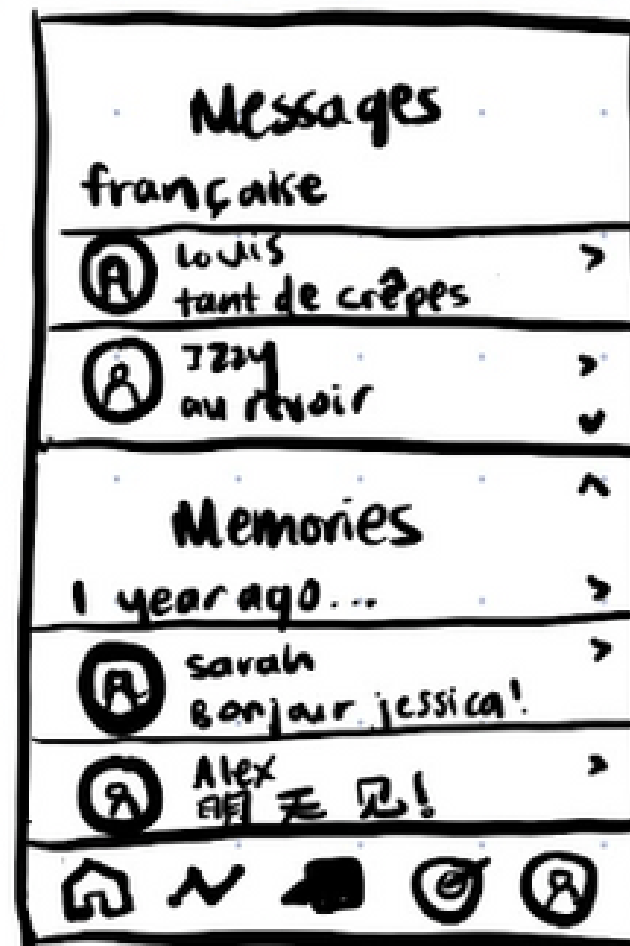

# Selected Realizations: Mobile and XR (AR+VR)

# Mobile: Key Sketches

# Mobile: Discussion

## Pros

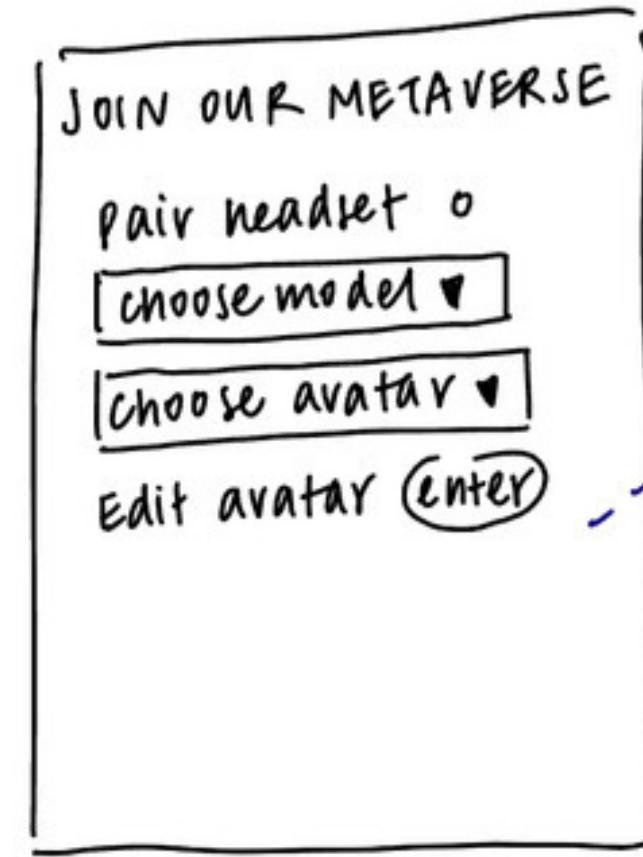

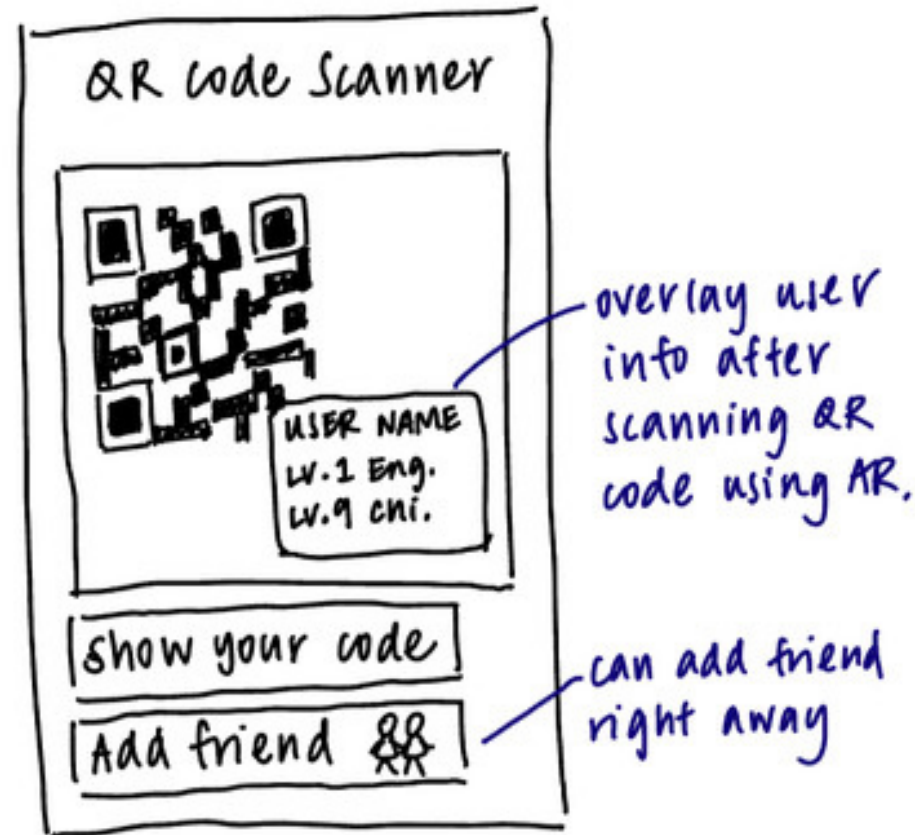

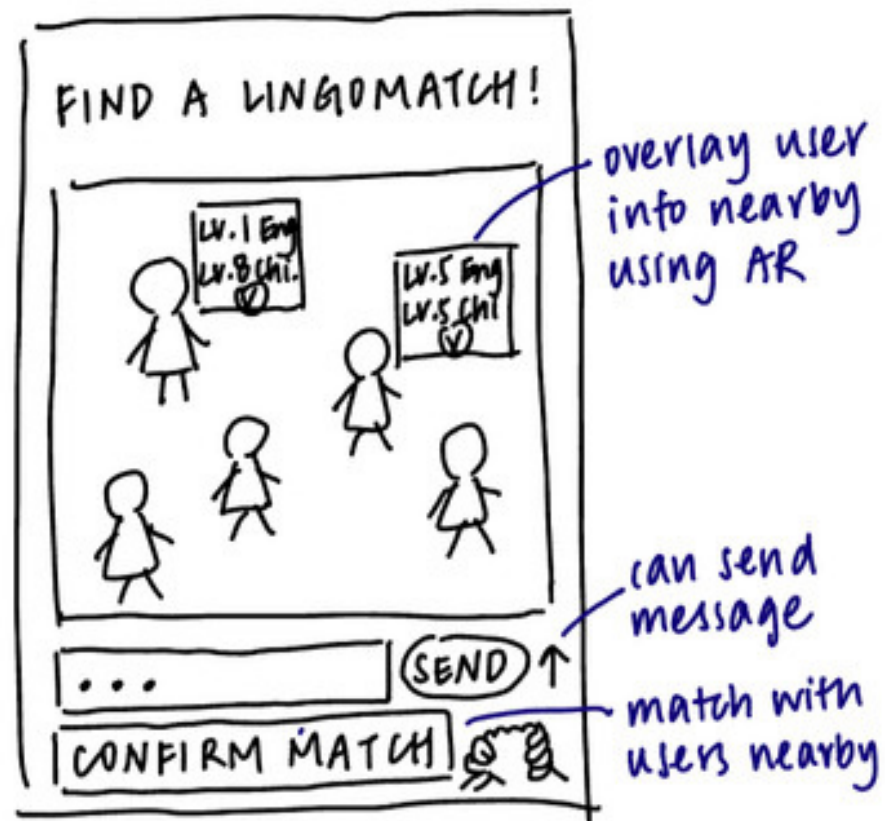

- Intuitive - users have existing mental models
- More accessible

## Cons

- Overdone
- Not immersive / ubiquitous
- Screen real estate limited

# XR: Key Sketches

Enter the metaverse version of our app.  
See virtual avatars with language levels.

# XR: Discussion

## Pros

- VR: can decrease the fear and pressure of having to interact with a person in real life.
- AR: UI that includes both people in real life and additional info via virtual overlaying.

## Cons

- VR: requires additional hardware (headset).
- AR: might make others uncomfortable if phone points at them.

# Why Mobile?

## **XR advantages not leveraged**

App functions use **2D** data (graphs and text) both of which don't leverage the full capabilities of XR.

**Flexibility** - an app that users can use anywhere without really needing to be in a certain situation.

# LO-FI Prototype

# Construction

## Features:

- Fixed bottom navigation bar
- Collection of screens for each tab
- Popups that we cut out and interjected

## Gestures:

- Only taps

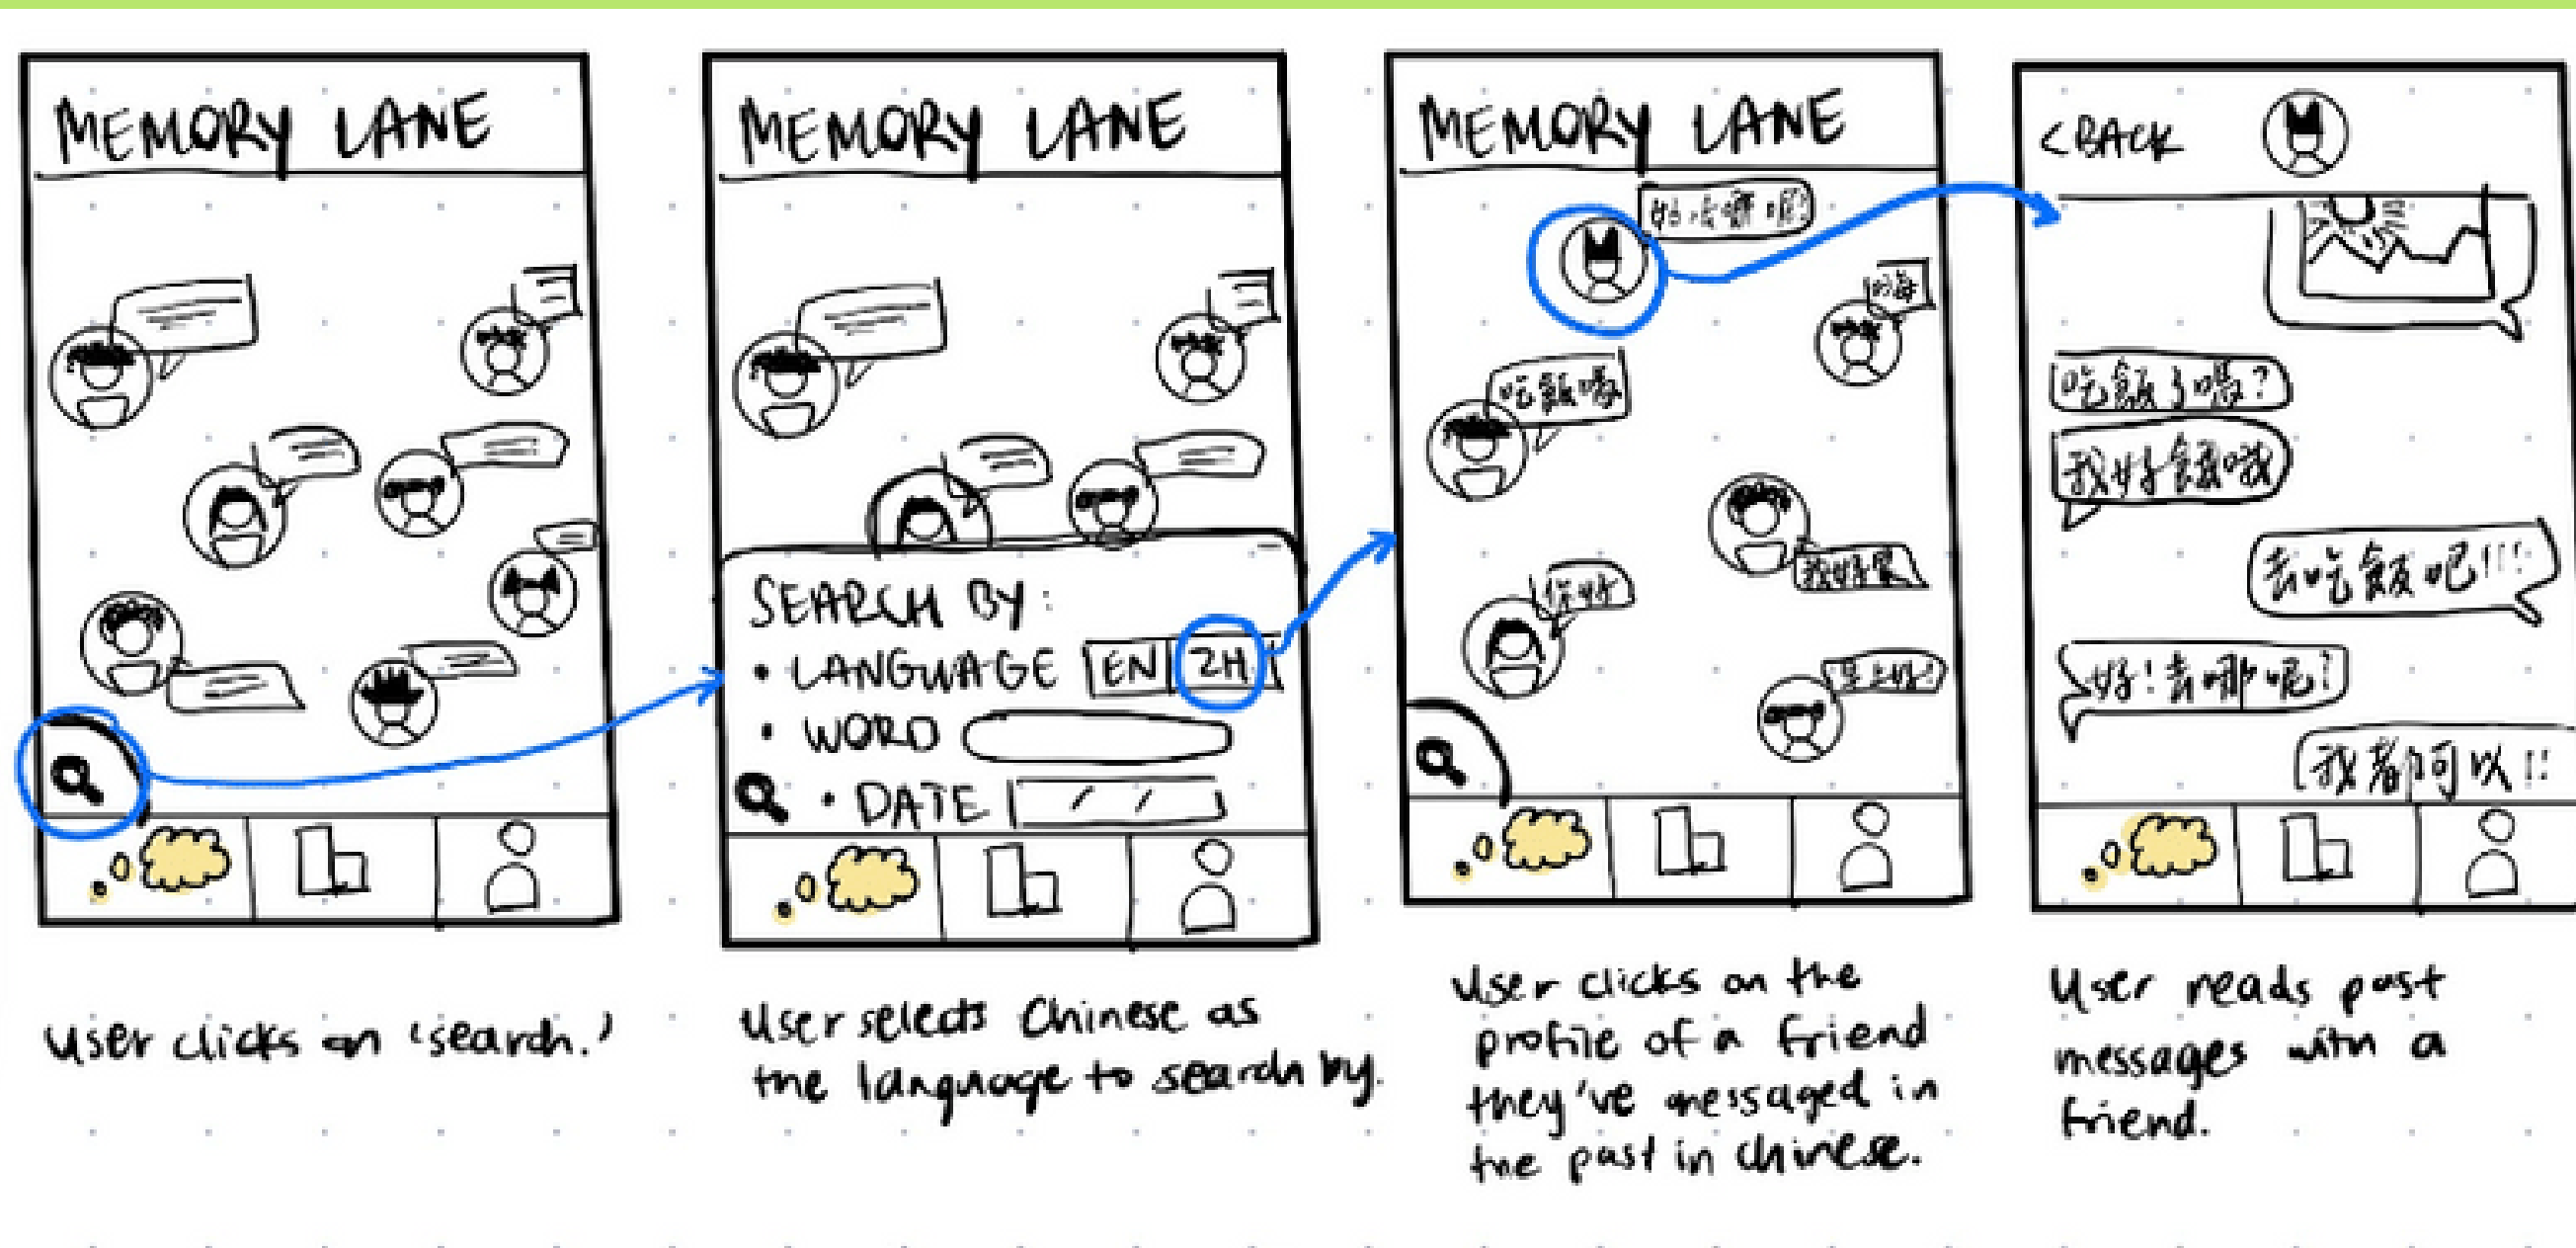

Built only out of paper, operated with hands.

# Task-Flow: Simple

View a random text memory in Chinese.

# Task-Flow: Medium

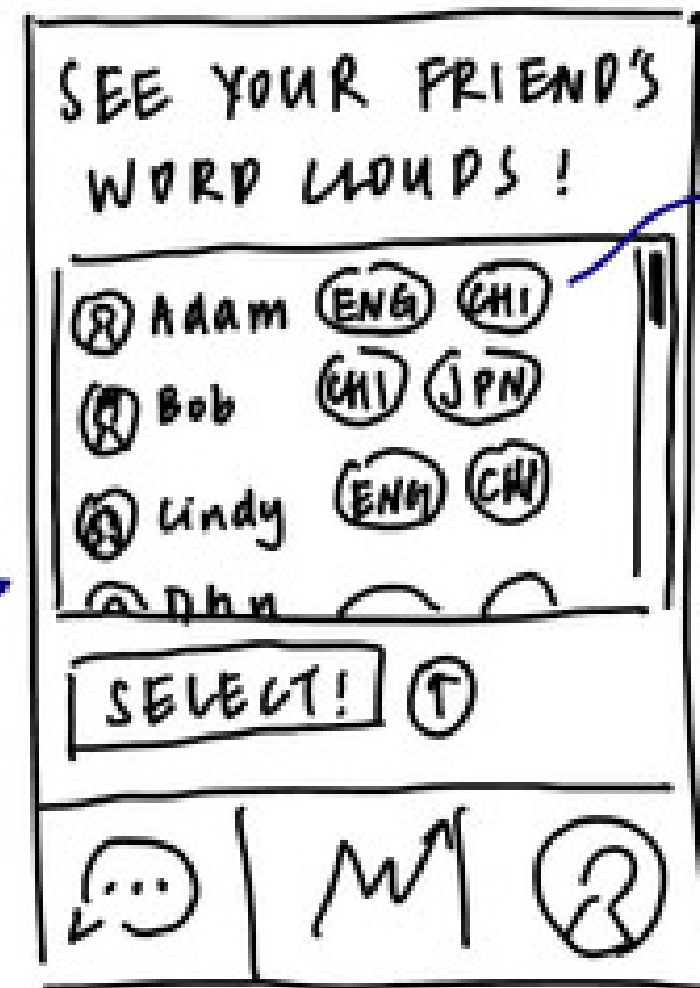

Share your Word Cloud with a friend.

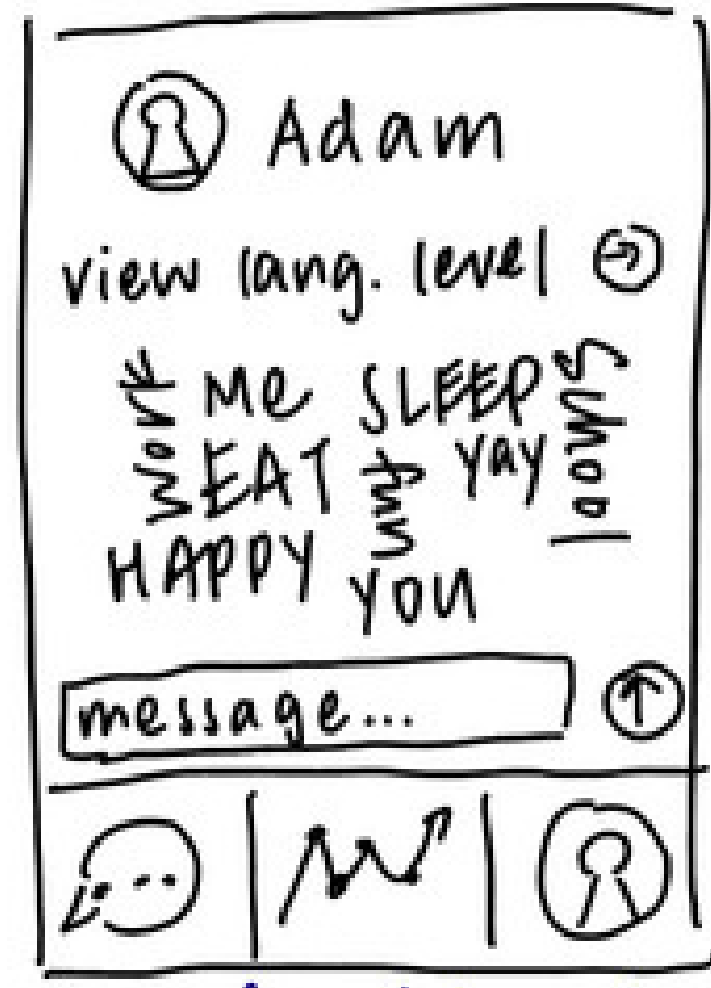

"word cloud" tab under my profile

view own word cloud and can share to others

can select & view friends' word cloud

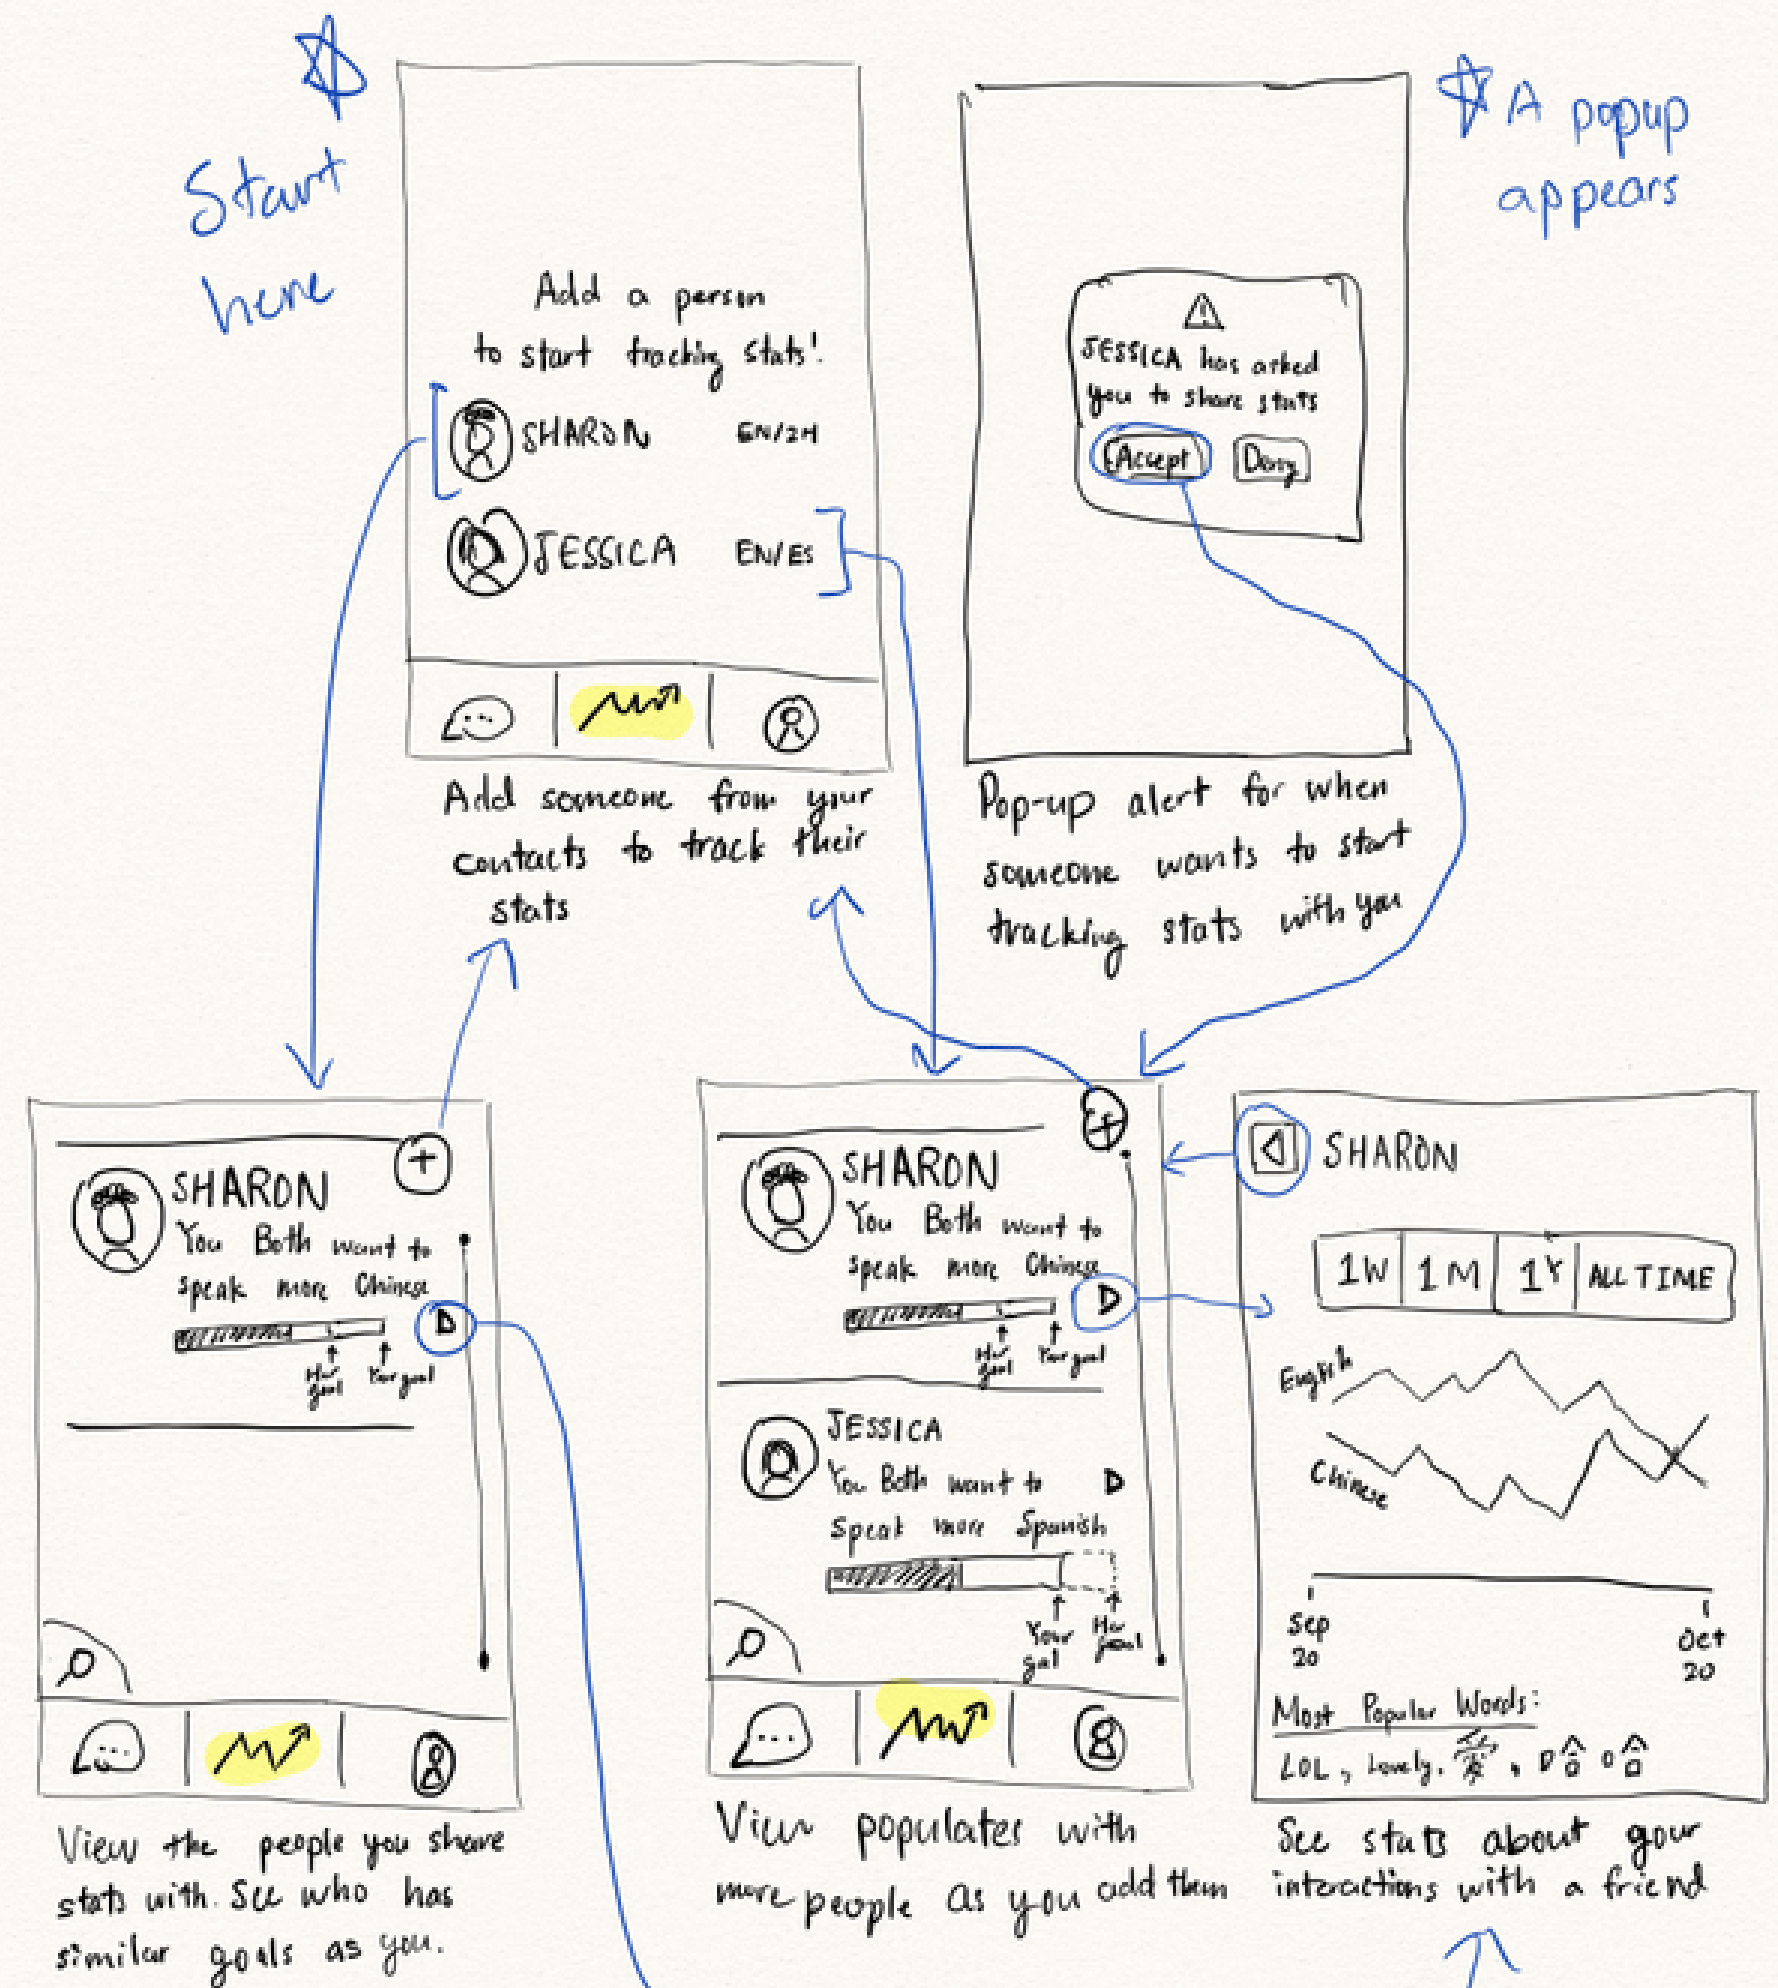

view friends' word cloud + message!

# Task-Flow: Complex

Add a Chinese-speaking friend to the app and view your joint language-use statistics.

Testing

# Participants

Found near Main Quad on Wednesday and Thursday!  
Compensated with Snickers.

# Procedure

*\*\* script in appendix*

- Introduction
- Background Info on App
- Demographic Questions
  - Age
  - Relationship with technology
  - Call vs. text %
  - Languages used
    - Few follow-up questions
- Task Introduction
  - Task 1- Simple
  - Task 2 - Medium
  - Task 3 - Complex
- General Feedback
- Candy

# Usability & Measurements

- **Fun**
  - Number of times user has a positive emotion.
- **Efficient**
  - Time spent per task.

# Results

# Big Picture

## Task Difficulty as Perceived by Users:

**Easiest** →→→ Simple → Complex → Medium →→→ **Hardest**

### Flaws of the Design: the Medium Task confusion

**4** users messed up at first:

- **3** users mistook the Memory icon for the cloud *despite* having completed the first task.
- **4** users navigated to Stats icons.

Only **1** user completed this task seamlessly.

### Flaws of the Prototype

- **3** users were unsure what language the displayed texts were in.

### Positive Reviews

- Users were enthusiastic about the idea.
- Complex Task was not perceived as very difficult.

# Baseline: by Task

	Simple	Medium	Complex
Mean time:	0.718 min	1.782 min	1.4 min
SD time:	0.163	0.543	0.339
Num pos emotions:	5	2	3

# Discussion

# Key Takeaways

Users are confused by current IA.

Icon selection is of utmost importance.

Every user has their own mental model based on other apps.

Users like app flexibility.

# Design Changes

Re-think Information Architecture (potentially with a card-sorting study).

Review designs of other common apps.

Add >1 path to perform the same task.

# What Testing Couldn't Reveal...

How quickly does the user learn the app? Paper was very unnatural, Figma would be a lot better.

What is the most useful feature?

How much value will this app actually bring?
