## InVision App

InVision App is an online tool that allows you to upload pre-made screens of your application (sketched in another tool such as Figma or Sketch) and create transitions between screens. You add "hotspots" to each of the screens, which link to other screens. This creates the effect of a working prototyped application, without the hassle of writing the actual code to transfer screens. InVision also supports a variety of gestures, such as swiping and tapping, as well as a variety of transitions between screens, such as dissolving and sliding.

## How to Use the Prototype

Buttons that are active will be highlighted in blue if the user clicks on an inactive area of the screen. The back arrow in the top left of some screens can be used to return to the previous screen. The buttons at the bottom of the screen can always be used to navigate to the Home, Memories, and User Profile screens. Tapping on dropdown menus will allow you to see all options for that selection bar. On the profile screen of one of your connections, swiping over the fire will take you to your recent notifications with that connection. Swipe back to return to the fire.

## Current Limitations

To focus on our main functionality and core tasks, we left out certain features, including registering as a new user, entering connections manually, connecting to Facebook, linking your schedule to Google Calendars, uploading different formats of media (video, audio, text, etc.), customizing texts to friends, searching for connections, and updating app settings. We plan to include as many of these as possible in later versions of the app. We also dictated what changes to text users could make, as well as what pictures, new connections, and schedule time slots users could select. This was due to the limitations of a medium-fi prototype, where we cannot code in functionalities like this. We also plan on adding the ability to send texts from the schedules page based on times when both people are free. Certain

features are also only available for certain connections, as this is sufficient to show the implementation of the features without needing to make separate screens and texts and photos for all of the different connections.

Hard-coded Features
---
All of the connections, friends, contacts, photos, past texts with friends, and available schedule blocks in our app are hard-coded. We did this to give a realistic user experience without being able to actually connect to the user's friends list, contacts, texts, or photos. We do not have any Wizard of Oz features in our app.
