ML Interpretability and Intrinsic Models

Apr 15, 2020
Dr. Wei Wei, Prof. James Landay

CS 335: Fair, Accountable, and Transparent (FAccT) Deep Learning
Stanford University
Recap

● Major Fairness Criteria
  ○ Fairness Through Unawareness
    ■ Sensitive feature A are being excluded when training ML models
  ○ Demographic Parity
    ■ Probabilities of distributing the favorable outcome across groups are the same
      \[ P(\hat{Y} = 1|A = 1) = P(\hat{Y} = 1|A = 0) \]
  ○ Equal Opportunity
    ■ Probabilities of distributing the favorable outcome to the qualified members across groups are the same
      \[ P(\hat{Y} = 1|A = 0, Y = 1) = P(\hat{Y} = 1|A = 1, Y = 1) \]
  ○ Equal Odds
    ■ Probabilities of distributing the favorable outcome to both qualified and unqualified members across groups are the same
      \[ P(\hat{Y} = 1|A = 0, Y) = P(\hat{Y} = 1|A = 1, Y) \]
Recap

- **Fair Representation Learning**
  - Prejudice Removing Regularizer

\[- \mathcal{L}(\mathcal{D}; \Theta) + \eta R(\mathcal{D}, \Theta) + \frac{\lambda}{2} \| \Theta \|^2_2\]

  - Loss of the Model
  - Fairness Regularizer
  - L2 Regularizer

- **Prejudice Removing Regularizer Minimizes Mutual Information**

\[
\text{PI} = \sum_{Y, S} \hat{P}_r[Y, S] \ln \frac{\hat{P}_r[Y, S]}{\hat{P}_r[S]\hat{P}_r[Y]}
\]

- **PI = 0 => \hat{Y} \perp S => Demographic Parity**
Outline

- Fair Representation Learning
- ML Interpretability
- Intrinsically interpretable models
  - Simple interpretable models
  - Intrinsically interpretable techniques for deep learning
- Interpretability Concepts
  - Intrinsic and post hoc methods
  - model-specific and model-agnostic methods
  - Local and global interpretable methods
  - Interpretability and Performance Trade-offs
Fair Representation Learning

- How Do We Test the Fairness of Deep Representation Z?
  - Adversarial Learning

I want to find the **best** representation for my task.

I want to find the **worst** representation that can reconstruct A.
Fair Representations

- How Do We Make a Deep Representation Z Fair?

Madras et al, 2018
Fair Representations

- How Do We Make a Deep Representation $Z$ Fair?
  - $Z = f(X)$
  - Test and see if a good amount of $A$ can be reconstructed from $Z$
  - Compare $A$ with $h(z)$

Madras et al., 2018
Fair Representations

● How Do We Make a Deep Representation Z Fair?
  ○ $Z = f(X)$
  ○ Test and see if a good amount of $A$ can be reconstructed from $Z$
  ○ Compare $A$ with $h(z)$

● Properties of Deep Representations
  ○ Achieve good performance for downstream task that generates $y = g(z)$

Madras et al., 2018
Fair Representations

● How Do We Make a Deep Representation Z Fair?
  ○ $Z = f(X)$
  ○ Test and see if a good amount of $A$ can be reconstructed from $Z$
  ○ Compare $A$ with $h(z)$

● Properties of Deep Representations
  ○ Achieve good performance for downstream task that generates $y = g(z)$
  ○ Has the Ability to Reconstruct $X = k(Z, A)$

Madras et al., 2018
Fairness Through Adversarial Learning

- **Adversarial Learning**
  - Models are trained using objectives that compete with each other

\[
\min_{f,g,k} \max_{h} \mathbb{E}_{X,Y,A} [L(f, g, h, k)]
\]

Madras et al., 2018
Fairness Through Adversarial Learning

- Adversarial Learning

\[ L(f, g, h, k) = \alpha L_C(g(f(X, A)), Y) + \beta L_{Dec}(k(f(X, A), A), X) + \gamma L_{Adv}(h(f(X, A)), A) \]

Madras et al., 2018
Loss for Learning Fair Representations

- **Adversarial Loss for Demographic Parity with Group** $\mathcal{D}_0, \mathcal{D}_1$

  $$L_{Adv}^{DP}(h) = 1 - \sum_{i \in \{0,1\}} \frac{1}{|\mathcal{D}_i|} \sum_{(x,a) \in \mathcal{D}_i} |h(f(x,a)) - a|$$

  Demographic Parity: $P(\hat{Y} = 1|A = 1) = P(\hat{Y} = 1|A = 0)$

- **Adversarial Loss for Equality of Odds with Group** $\mathcal{D}_i^j = \{(x, y, a) \in \mathcal{D}|a = i, y = j\}$

  $$L_{Adv}^{EO}(h) = 2 - \sum_{(i,j) \in \{0,1\}^2} \frac{1}{|\mathcal{D}_i^j|} \sum_{(x,a) \in \mathcal{D}_i^j} |h(f(x,a)) - a|$$

  Equality of Odds: $P(\hat{Y} = 1|A = 0, Y) = P(\hat{Y} = 1|A = 1, Y)$

---

Madras et al. 2018
Discrimination Measures for Representations

\[ Z_1 = p(Z|A = 1) \quad Z_0 = p(Z|A = 0) \quad Z_a^y = p(Z|A = a, Y = y) \]

- **Demographic Parity**

\[ \Delta_{DP}(g) \triangleq d_g(Z_0, Z_1) = |E_{Z_0}[g] - E_{Z_1}[g]| \]

Demographic Parity: \( P(\hat{Y} = 1|A = 1) = P(\hat{Y} = 1|A = 0) \)

- **Equality of Odds**

\[ \Delta_{EO}(g) \triangleq |E_{Z_0}[g] - E_{Z_1}[g]| + |E_{Z_0}[1 - g] - E_{Z_1}[1 - g]| \]

Equality of Odds: \( P(\hat{Y} = 1|A = 0, Y) = P(\hat{Y} = 1|A = 1, Y) \)

- **Equality of Opportunities**

\[ \Delta_{EOpp}(g) \triangleq |E_{Z_0}[g] - E_{Z_1}[g]| \]

Equality of Opportunity: \( P(\hat{Y} = 1|A = 0, Y = 1) = P(\hat{Y} = 1|A = 1, Y = 1) \)
Accuracy and Fairness on Adult Income Dataset

- Results Generated By Varying $\gamma$

\[ L(f, g, h, k) = \alpha L_C(g(f(X, A)), Y) + \beta L_{Dec}(k(f(X, A), A), X) + \gamma L_{Adv}(h(f(X, A)), A) \]

DP-CE - Cross Entropy Adversarial Objective (Edwards et al., 2016)

Madras et al., 2018
Transferring Fair Representations

- If the Representations Are Fair, All Predictors Should Be Fair!
  - Train \( f \) and \( g \) based on domain 1 with feature space \( X \)
  - Fix \( f \), and train \( g' \) on domain 2 with the same feature space \( X \)
    - \( y=g'(f(x)) \) should be a fairness predictor

Madras et al. 2018
Transfer Fair Representations

- **Heritage Health Dataset**
  - Comprises insurance claims and physician records
  - Task 1 - Predict Charlson index (prediction of 10 year survival of patients) trained using equalized odds adversarial objective
  - Task 2 - Same input, task becomes predicting a patient’s insurance claim corresponding to a specific medical condition

Transfer- unf - MLP with no fairness constraints
Transfer- fair - MLP with fairness constraints in Bechavod et al, 2017
Transfer - Y - Adv baseline in Zhang et al, 2018

Madras et al, 2018
Discussions

- What Are the Pros and Cons of Prejudice Removing Regularizer and Adversarial Learning for Fairness?
Next Fairness Lectures

- May 6 Fairness Through Input Manipulations
- May 8 Fair NLP
- May 13 Fairness for Vision Representations
Outline

● Fair Representation Learning
● ML Interpretability
● Intrinsically interpretable models
  ○ Simple interpretable models
  ○ Intrinsically interpretable techniques for deep learning
● Interpretability Concepts
  ○ Intrinsic and post hoc methods
  ○ model-specific and model-agnostic methods
  ○ Local and global interpretable methods
  ○ Interpretability and Performance Trade-offs
Machine Learning Interpretability

- ML interpretability allows one to examine model's basis in its decision making process.

An interpretable tree model to find out the kind of contact lens a person may wear.

A neural network which is usually considered a black-box model.
VGG19 Architecture

46 layers

143,667,240 parameters

model size: 575 MB
Visualizations of GoogLeNet

Edges (layer conv2d0)  
Textures (layer mixed3a)  
Patterns (layer mixed4a)  
Parts (layers mixed4b & mixed4c)  
Objects (layers mixed4d & mixed4e)
Reasons for ML Interpretability

● Our society has been shifted to rely on AI more than ever
  ○ autonomous vehicles
  ○ security
  ○ finance
  ○ many others

● Who will benefit from ML Interpretability?
  ○ End Users: enhance trust, understand the consequences of the decisions, e.g., privacy, fairness.
  ○ Regulatory Agencies: compliance, audits, and accountability.
  ○ Model Designers: diagnose model performance
Regulations Financial Models
Precision Medicine (Caruana et al., 2015)

- Predict probability of death for patient with pneumonia
  - high probability -> hospital/ICU
  - low probability -> treated as outpatients

- ML models make mistakes
  - biases in the dataset exist for asthma
  - asthma is a serious condition that has to be admitted to hospitals or even ICUs
  - mistakes from neural nets on asthma prevented clinical trials in mid-90's
Medical Imaging (Sundararajan et al., 2017)

- A Diabetic Retinopathy Grade is detected from a retinal fundus image
- Gradient based techniques are used to demonstrate the basis of the model's decisions
Legal Tool Explanation (Tan et al., 2018)

- A legal case (Lightbourne, 2017) challenges the use of a software called "COMPAS" when sentencing individuals to prison
  - alleged use of gender and race features in its decision making process
  - algorithm details are considered to be trade secrets and are not transparent

- Mimicking Model Behaviors
  - Model distillation is used to mimic model behaviors
  - Interpretable models are used to explain the behaviors of black box models
Question Answering (Seo et al, 2017)

- Explanation of question answering systems
  - highlighted keywords on context & questions

Super Bowl 50 was an American football game to determine the champion of the National Football League (NFL) for the 2015 season. The American Football Conference (AFC) champion Denver Broncos defeated the National Football Conference (NFC) champion Carolina Panthers 24–10 to earn their third Super Bowl title. The game was played on February 7, 2016, at Levi's Stadium in the San Francisco Bay Area at Santa Clara, California. As this was the 50th Super Bowl, the league emphasized the "golden anniversary" with various gold-themed initiatives, as well as temporarily suspending the tradition of naming each Super Bowl game with Roman numerals (under which the game would have been known as "Super Bowl 50"), so that the logo could prominently feature the Arabic numeral "50."

There are 13 natural reserves in Warsaw—among others, Biebrza Valley, Kabaty Woods, Czerniaków Lake. About 13 kilometers (9 miles) from Warsaw, the Vistula River’s environment changes strikingly and features a perfectly preserved ecosystem, with a habitat of animals that includes the otter, beaver and hundreds of bird species. There are also several lakes in Warsaw—mainly the inside lakes, like Czerniaków Lake, the lakes in the Łazienki or Wilanów Parks, Kamionki Lake. There are lot of small lakes in the parks, but only a few are permanent; the majority are emptied before winter to clean them of plants and sediments.
Image Caption Generation (Selvaraju et al., 2017)

- Highlighted regions explaining an image caption generation algorithm.
Right to Explanation

- **Credit Scores in United States**
  - Equal Credit Opportunity Rights (Regulation B of the [Code of Federal Regulations](https://www.gpo.gov/fdsys/search/) 12 CFR 226.27)
  - Creditors are required to notify applicants of action taken with statement of specific

- **European Union General Data Protection Regulation**
  - GDPR 1995 provided a legally disputed form of a right to an explanation [Recital 71](https://www.eur-lex.europa.eu) 
  - "The data subject should have the right not to be subject to a decision, which may include a measure, evaluating personal aspects relating to him or her which is based solely on automated processing..."

- **France**
  - In a decision taken on the basis of an algorithmic treatment, the rules that define that treatment and its “principal characteristics” must be communicated to the citizen upon request
    - the degree and the mode of contribution of the algorithmic
    - the data processed and its source
    - the treatment parameters, and where appropriate, their weighting
    - the operations carried out by the treatment.
Surge in Explainable Research (Arrieta et al., 2019)
Outline

- Fair Representation Learning
- ML Interpretability
- Intrinsically interpretable models
  - Simple interpretable models
  - Intricically interpretable techniques for deep learning
- Interpretability Concepts
  - Intrinsic and post hoc methods
  - Model-specific and model-agnostic methods
  - Local and global interpretable methods
  - Interpretability and Performance Trade-offs
Intrinsically interpretable models

- Models that are interpretable by design
- No post-processing steps are needed to achieve interpretable.
Linear Regression

\[ y_i = \beta_0 + \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \epsilon_i = x_i^T \beta + \epsilon_i, \quad i = 1, \ldots, n, \]

interpretable components
Decision Trees
K-Nearest Neighbors
Bayesian Models

Latent Dirichlet Allocation (Blei et al., 2003)

Documents

XXXX XXXX I purchased a vehicle from XXXX XXXX XXXX XXXX which I traded in my XXXXXXXXXX. I then signed contract and release of liability to the XXXXX. I still have the contract. Three years later I received a letter from a collection agency that I owe them XXXX dollars for the car I traded in. That was towed from XXXX XXXX XXXX XXXX said at the time the car was still in my name. So I went back to the dealer and the dealer before was sold to another company. I spoke with XXXX XXXX and did what they told me and it is still on my credit report. I am really frustrated on what I am going through. The collectors will not listen to me. What can I do. The agency is XXXX Collections in XXXX XXXX California.
Outline

● ML Interpretability

● Intrinsically interpretable models
  ○ Simple interpretable models
  ○ Intricically interpretable techniques for deep learning

● Interpretability Concepts
  ○ Intrinsic and post hoc methods
  ○ model-specific and model-agnostic methods
  ○ Local and global interpretable methods

● Interpretability and Performance Trade-offs
Sparsity

- Controls the sparsity of model parameters when learning a model
- Popular choices
  - L1 regularization
    \[ ||w||_1 = |w_1| + |w_2| + \ldots + |w_N| \]
  - L2 regularization
    \[ ||w||_2 = (w_1^2 + w_2^2 + \ldots + w_N^2)^{\frac{1}{2}} \]
Sparsity for Interpretable Linear Regression

- In the case of linear regression
  - $\hat{y} = w_1 x_1 + w_2 x_2 + \ldots + w_N x_N + b$
- Linear regression with L1 regularization
  - $Loss = Error(y, \hat{y}) + \lambda \sum_{i=1}^{N} |w_i|$
- Linear Regression with L2 regularization
  - $Loss = Error(y, \hat{y}) + \lambda \sum_{i=1}^{N} w_i^2$
Interpretable Neural Embeddings *(Subramanian et al., 2018)*

- Dense representations make it difficult for human to interpret
- Goal: Generate sparse and interpretable word embeddings

[Diagram of interpretable neural embeddings]
Interpretable Neural Embeddings (Subramanian et al., 2018)

- Use Sparse Autoencoder to generated interpretable word embeddings

\[
\tilde{x} = g(z^x)
\]

\[
z^x = f(x)
\]
Interpretable Neural Embeddings (Subramanian et al., 2018)

- Add sparse constraints to the auto-encoder
  - Unit-wise sparsity constraint enforces sparsity for each unit
  - Layer-wise sparsity constraint controls the number of activations for each layer

\[
\mathcal{L} = \sum_{i} (|x_i - \tilde{x}_i|^2) + \sum_{h} z^{x_i}_h \times (1 - z^{x_i}_h) + \max(0, \sum_{m} (\sigma(z^{x_i}_h)/m - \rho)/N)
\]

- \(\mathcal{L}\): reconstruction loss
- \(z^{x_i}_h\): unit-wise sparsity constraint
- \(\sigma(z^{x_i}_h)/m - \rho\): layer-wise sparsity constraint
- \(\sigma\): activation function
- \(\rho\): target activation rate

Regularization for Saliency Maps (Plumb et al, 2019)

- Saliency Maps
  - A gradient based method to generate visualizations to interpret deep neural networks

\[ x \]

\[ e(f, x) \]
Regularization for Saliency Maps (Plumb et al., 2019)

- **Saliency Maps**
  - $e(x, f)$ generates a saliency map for a deep learning model $f$ on a given image $x$

- **Stabilization Regularization**
  - Stabilizes the saliency map of $x$ and its nearby samples

$$S(f, x) = \mathbb{E}_{x' \sim N_x} \| e(f, x) - e(f, x') \|^2_2$$

- Stabilization regularizer
- Neighbors of $x$
- Saliency maps
Regularization for Saliency Maps (Plumb et al, 2019)

- **Saliency Maps**
  - \( e(x, f) \) generates a saliency map for a deep learning model \( f \) on a given image \( x \)

- **Stabilization Regularization**
  - Stabilizes the saliency map of \( x \) and its nearby samples

Stabilization regularizer:

\[
S(f, x) = \mathbb{E}_{x' \sim N_x} \| e(f, x) - e(f, x') \|^2_2
\]

Final loss function:

\[
\mathcal{L} = \frac{1}{N} \sum_{i=1}^{N} \mathcal{L}(f(x_i), y_i) + \gamma S(f, x_i)
\]
Regularization for Saliency Maps (Plumb et al, 2019)

- Mnist samples
- Saliency map without regularization
- Saliency map with regularization
Bayesian Deep Learning

- Modeling the Distributions of Neural Network Parameters
  - A distribution of neural networks co-exist at any time
  - Networks are initialized using a prior and each play a role in modeling uncertainties

A Deep Neural Network with Deterministic Parameters

A Bayesian Deep Neural Network with a distribution over parameters

\[ w \sim \text{uniform}(-1, 1) \]

\[ w^i \sim \mathcal{N}(0, I) \]
Epistemic and Heteroscedastic Uncertainty (Kendall et al, 2017)

- Increased aleatoric uncertainty on object boundaries and for objects far from the camera.
- Increased epistemic uncertainty for semantically and visually challenging pixels.

Neural Logic Induction Learning (Yang et al., 2020)

“An object that has wheels and windows is a car”

```
Car(Car) ← Of(Wheel, Car) ∧ Window(Car)
```

“An object that is inside the car with clothing is a person”

```
Person(Person) ← Car(Car) ∧ Inside(Person, Car) ∧ On(Clothing, Person)
```
Neural Basis Expansion (Oreshkin el al, 2020)

- Time series forecasting
  - Given historical data, predict future values.
Neural Basis Expansion (Oreshkin et al., 2020)
Outline

- Fair Representation Learning
- ML Interpretability
- Intrinsically interpretable models
  - Simple interpretable models
  - Intricically interpretable techniques for deep learning
- Interpretability Concepts
  - Intrinsic and post hoc methods
  - model-specific and model-agnostic methods
  - Local and global interpretable methods
  - Interpretability and Performance Trade-offs
Intrinsic and Post Hoc Interpretability

- **Intrinsically interpretable models**
  - Interpretable is achieved by model design
  - ML models are explainable by itself
  - Explainability is often achieved as a byproduct of model training

- **Post Hoc/Model-specific methods**
  - Explainability is often achieved after the model is trained
  - Interpretable is achieved using external methods
Post Hoc Interpretability

- One of the way to achieve Post Hoc Interpretability is to deploy a local proxy model.
- We will introduce more about Post Hoc Interpretable methods in the next lecture.
Model Specific and Model Agnostic Methods

- **Model Specific Methods**
  - Techniques that can be used for a specific architecture
  - Usually preferable when you have the ability to design your own model
  - Model specific techniques might compromise the performance of your model
  - Requires training the model using a dataset
  - Intrinsic methods are by definition model specific

- **Model-agnostic Methods**
  - Techniques that can be used across many black box models
  - Model-agnostic methods will not affect the performance of your model
  - Do not require training the model
  - Will be covered in the next lecture
  - Post hoc methods are usually model-agnostic
Global and Local Interpretability

● Global Interpretability
  ○ Explains the entire ML model at once from input to prediction
    ■ 1) Holistic Model Interpretability
    ■ 2) Modular Level Interpretability
  ○ e.g., Decision Trees, Linear regression

● Local Interpretability
  ○ Explain how predictions change for when input changes
    ■ 1) For a single prediction
    ■ 2) for a group of predictions
Global Interpretability

Feature

frisbee
Interpretability and Performance Trade-offs

- Highly performed models tend to be less interpretable.
- Can powerful models with complex structures be interpretable at the same time?
