

CS377E: DESIGNING SOLUTIONS TO GLOBAL GRAND CHALLENGES
FOUNDATION MODELS FOR EDUCATIONAL EQUITY

Advanced Interaction Design

Prof. James A. Landay
Computer Science Department
Stanford University

Spring 2023
May 8, 2023

*based on slides by Julie Stanford

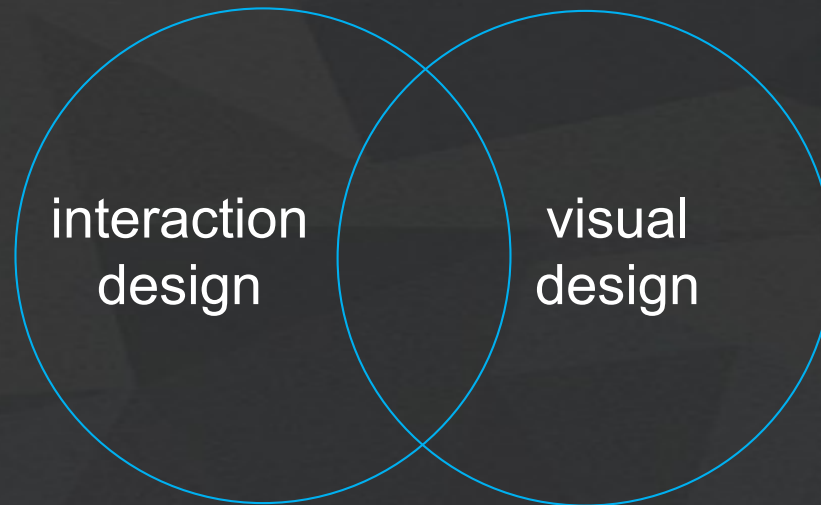

Outline

- Interaction design vs. visual design
- Timeline of use
- Implicit interactions
- The basics
 - 80/20 rule
 - Affordances
 - Consistency
 - Mapping
 - Progressive disclosure
 - Visual hierarchy
 - Organizing information

What is Interaction Design?

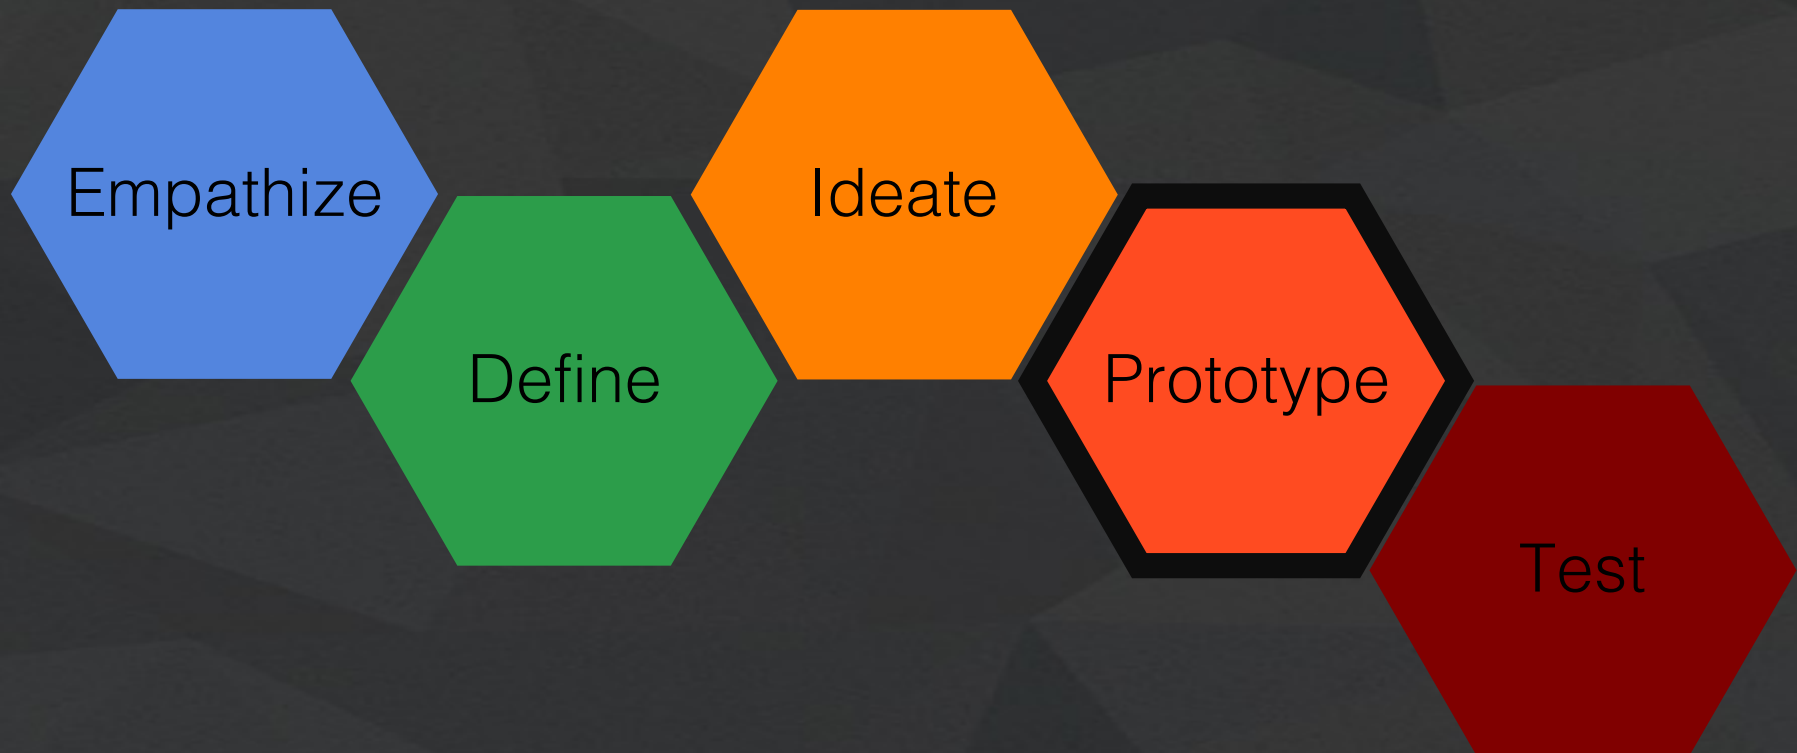

The practice of designing interactive digital products, environments, systems, and services

Interaction Design vs. Visual Design

How much overlap?

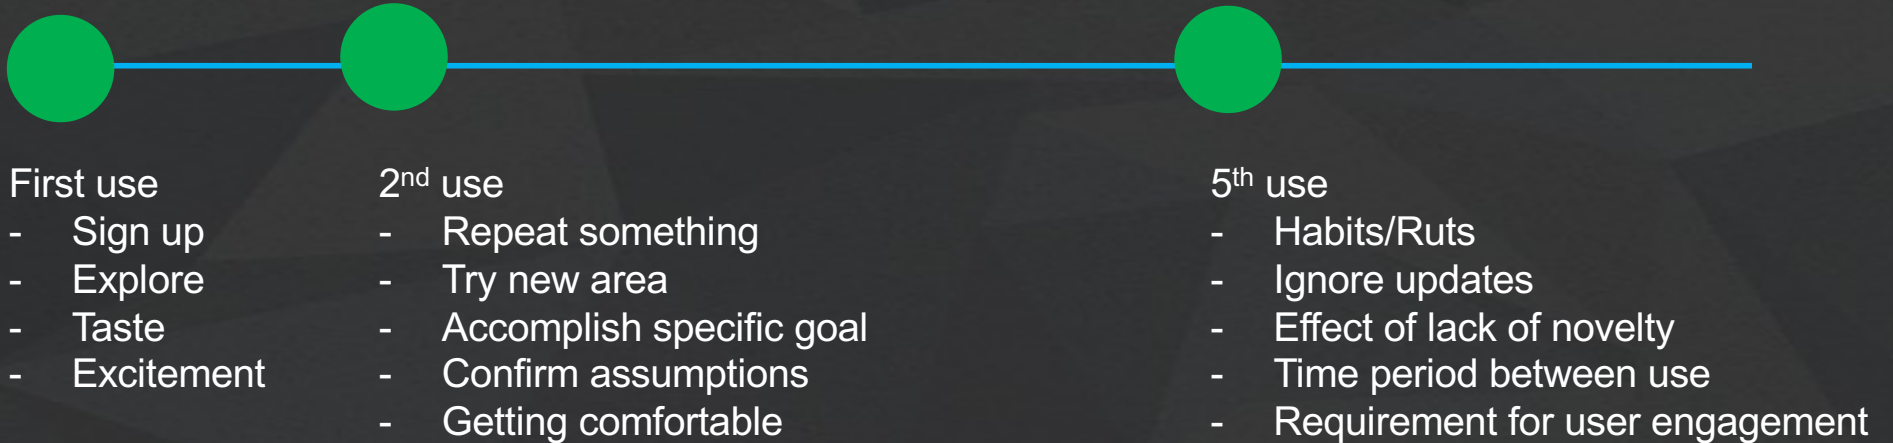

Where does it fit in the process?

What to think about when you are designing

Timeline of Use

People will use your UI over time

Timeline how to

- Think about not just first use but 2nd use, and 10th use...how do things change?
- What stays fresh? What becomes tedious?

Implicit Interactions

“Sensing and computation need to be augmented with an understanding of the unstated expectations people have from our interactive counterparts.”

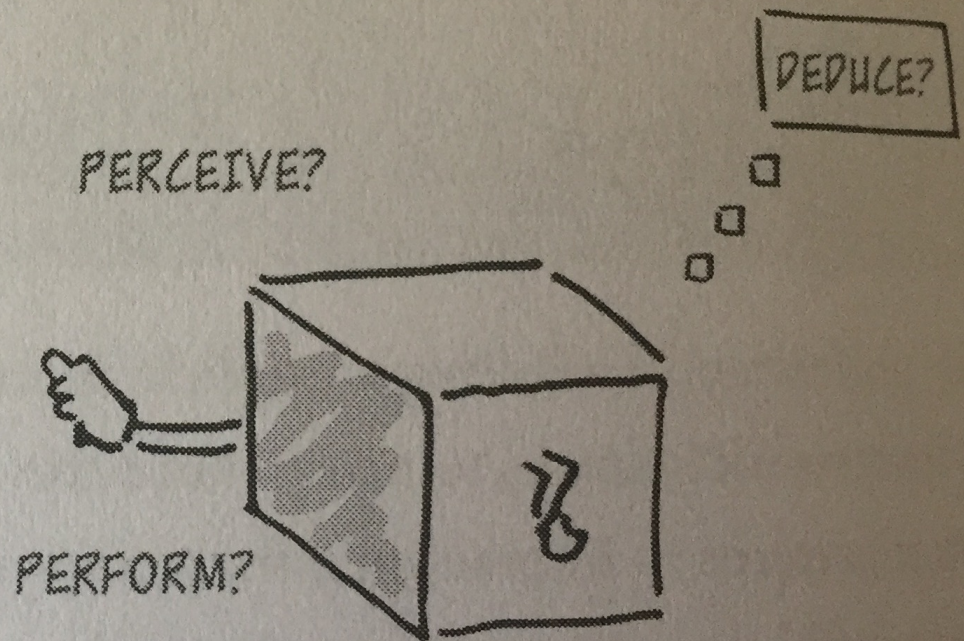

- Wendy Ju

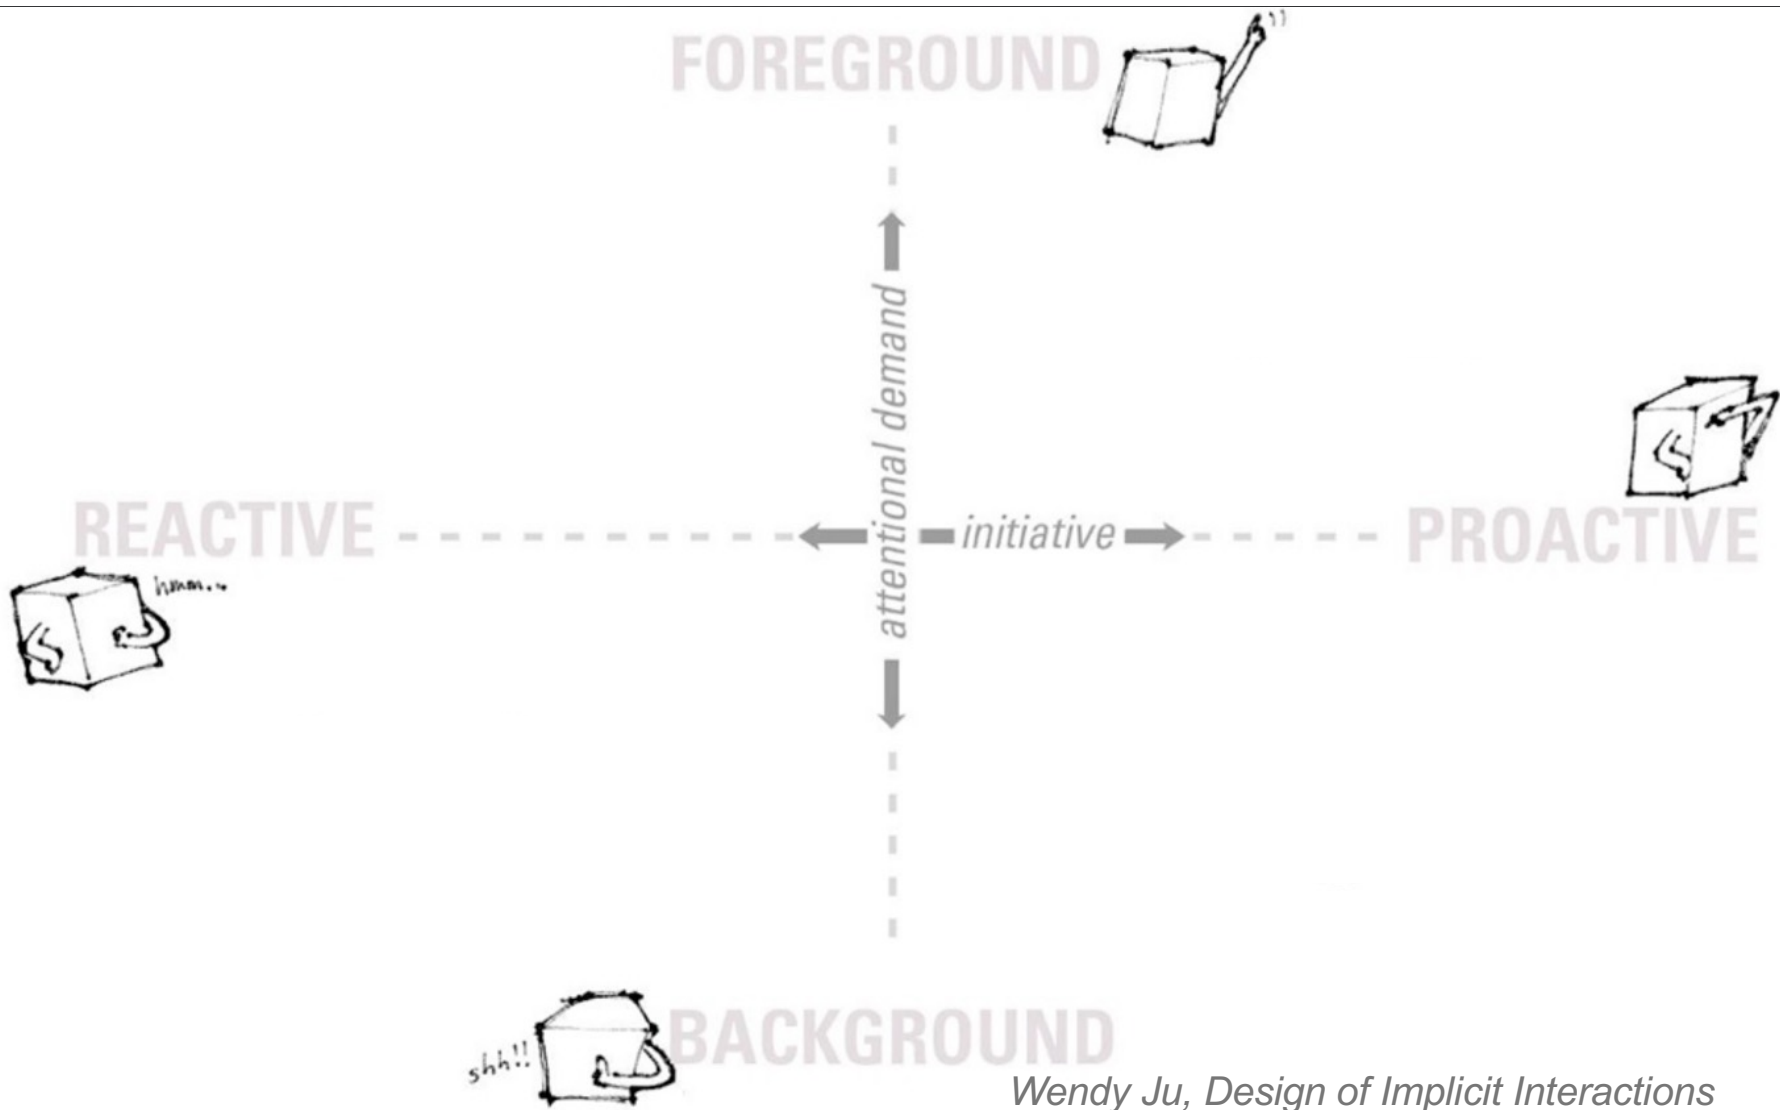

The Design of Implicit Interactions

WHAT IS THE PERSON...

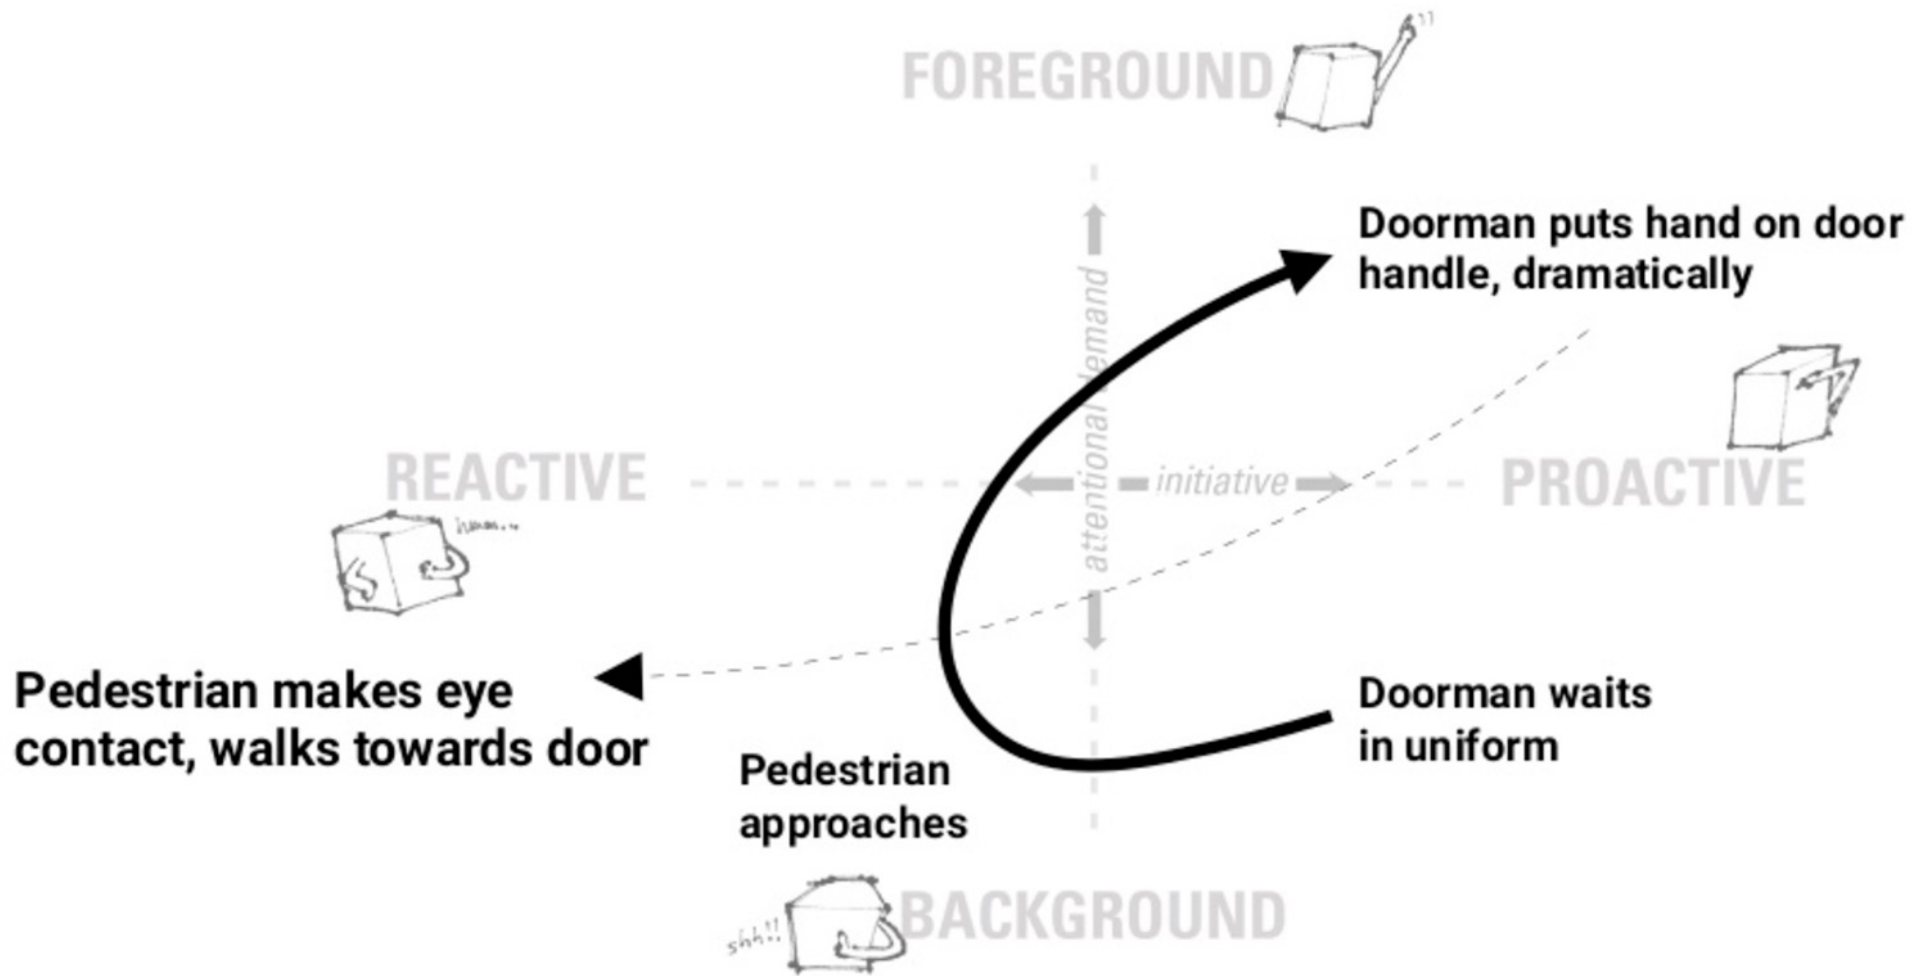

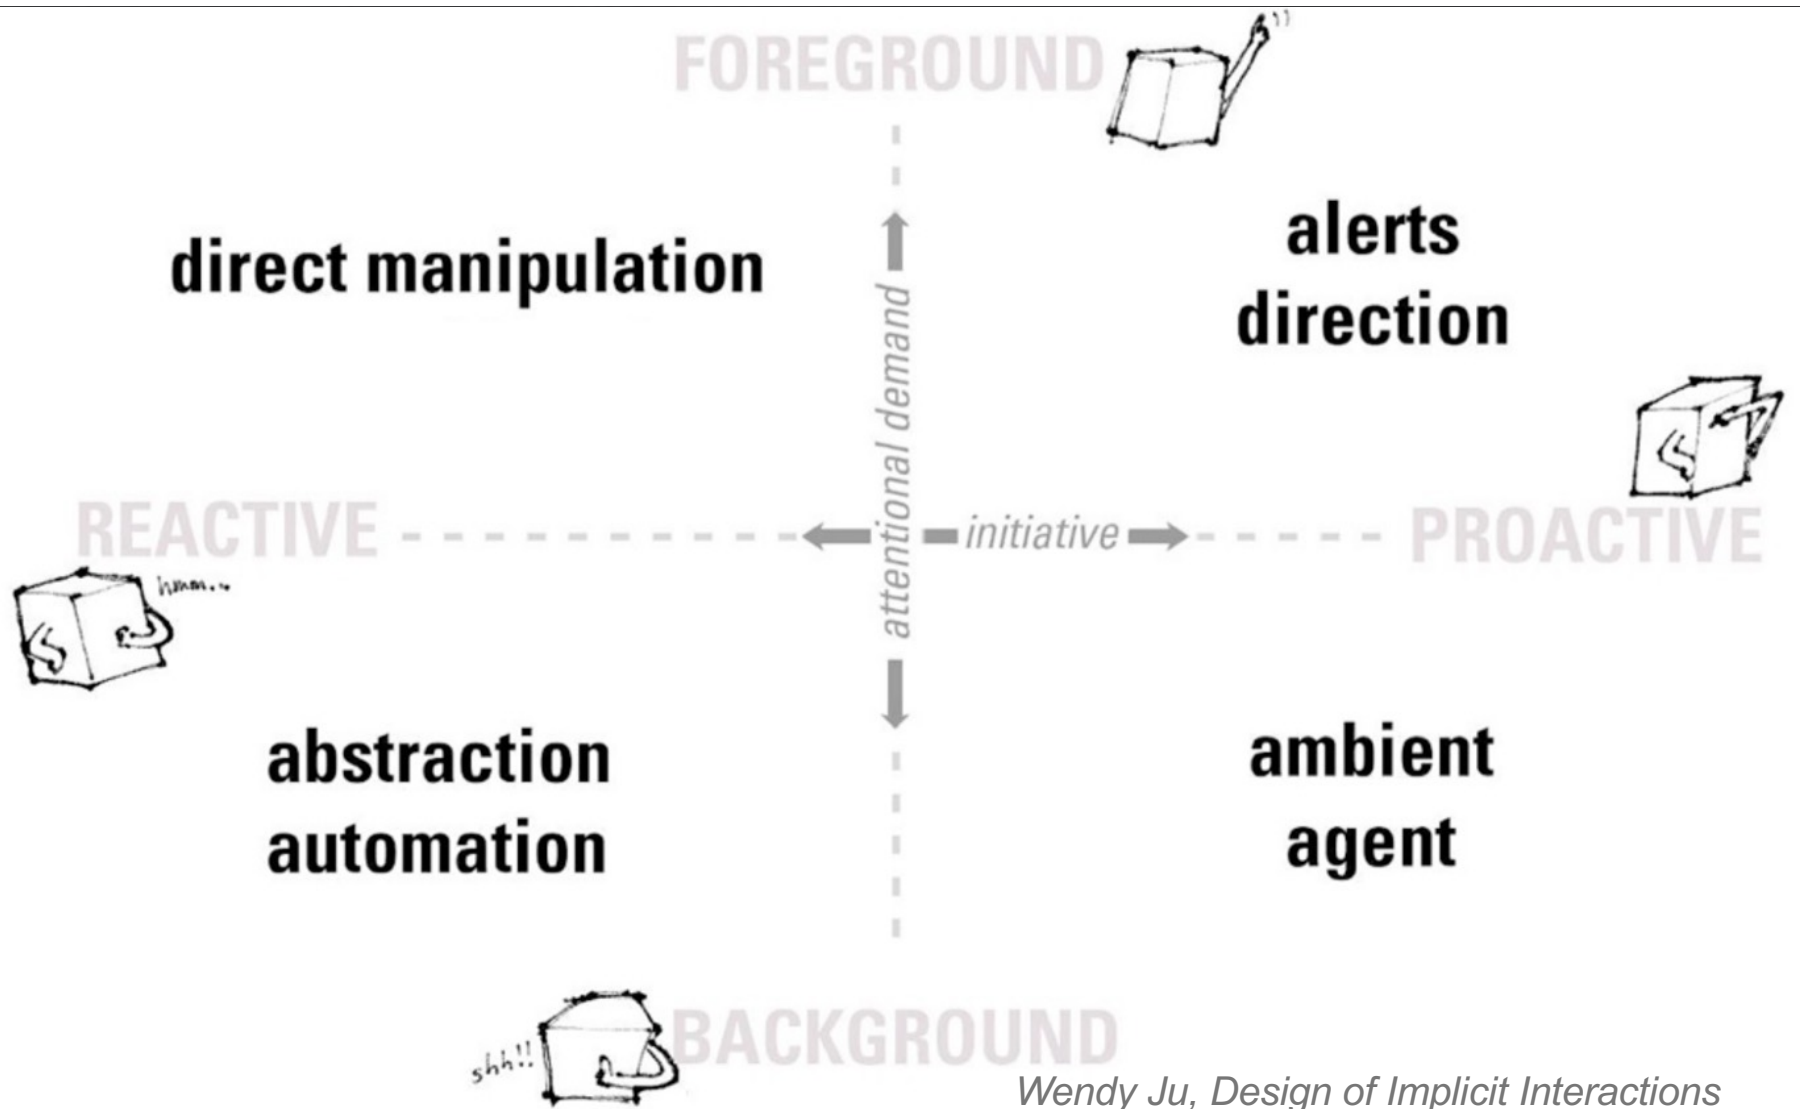

WHAT DOES THE INTERACTIVE OBJECT...

Wendy Ju, *Design of Implicit Interactions*

Wendy Ju, *Design of Implicit Interactions*

FOREGROUND

You use a DVR to record a show

DVR suggests a show you might like

REACTIVE

DVR records a pre-set weekly show

initiative

PROACTIVE

DVR pre-records shows you might like on its own

attentional demand

BACKGROUND

Wendy Ju, Design of Implicit Interactions

What does this mean for your UIs?

Think about all the potential ways the user is implicitly interacting with your experience.

Example: Light switch state: On/Off

User's State:

- Can see the light is on
- Sees the light is on but thinks it should be off
- Doesn't notice the light is on but would want it off
- Might want to turn it off if it were clear how to
- Doesn't know if he is responsible for the light or not

Implicit interactions how to

- Consider *all* the mental states that the user might have when they are engaging with your interface (make a list!)
- How will the interface react? What social cues will it use?

and don't forget the basics...

80/20 rule

Ribbon in Microsoft Office

A high percentage of effects in any large system are caused by a low percentage of variables. Also known as Pareto's Principle. – *Universal Principles of Design*

“Users use 20% of the features 80% of the time.”

80/20 rule: CS247 microwave redesign

Removed unnecessary buttons

Only functionality to increase time

Most important buttons larger

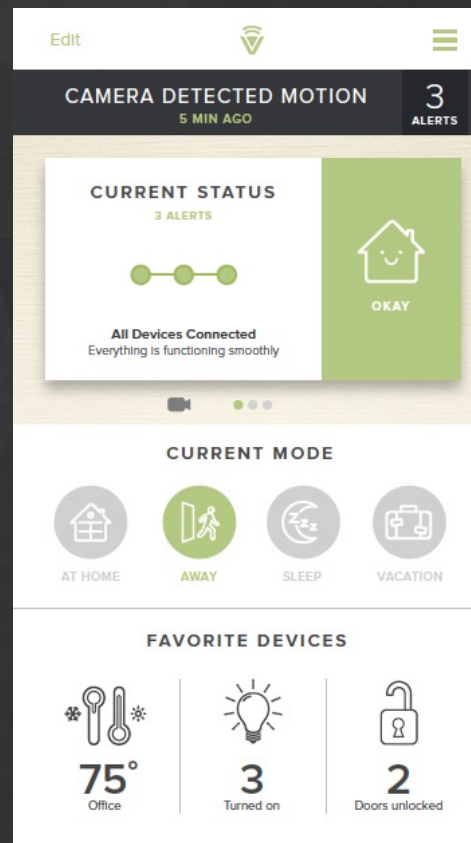

80/20 rule: Cross-platform design

80/20 rule how to

- List all the things your user may want to do
- Select 20% of them as the key things
- Ensure those 20% of things are easy & fast
- Question your need for the other 80%

Affordances

Consistency

Windows 10 build 10162

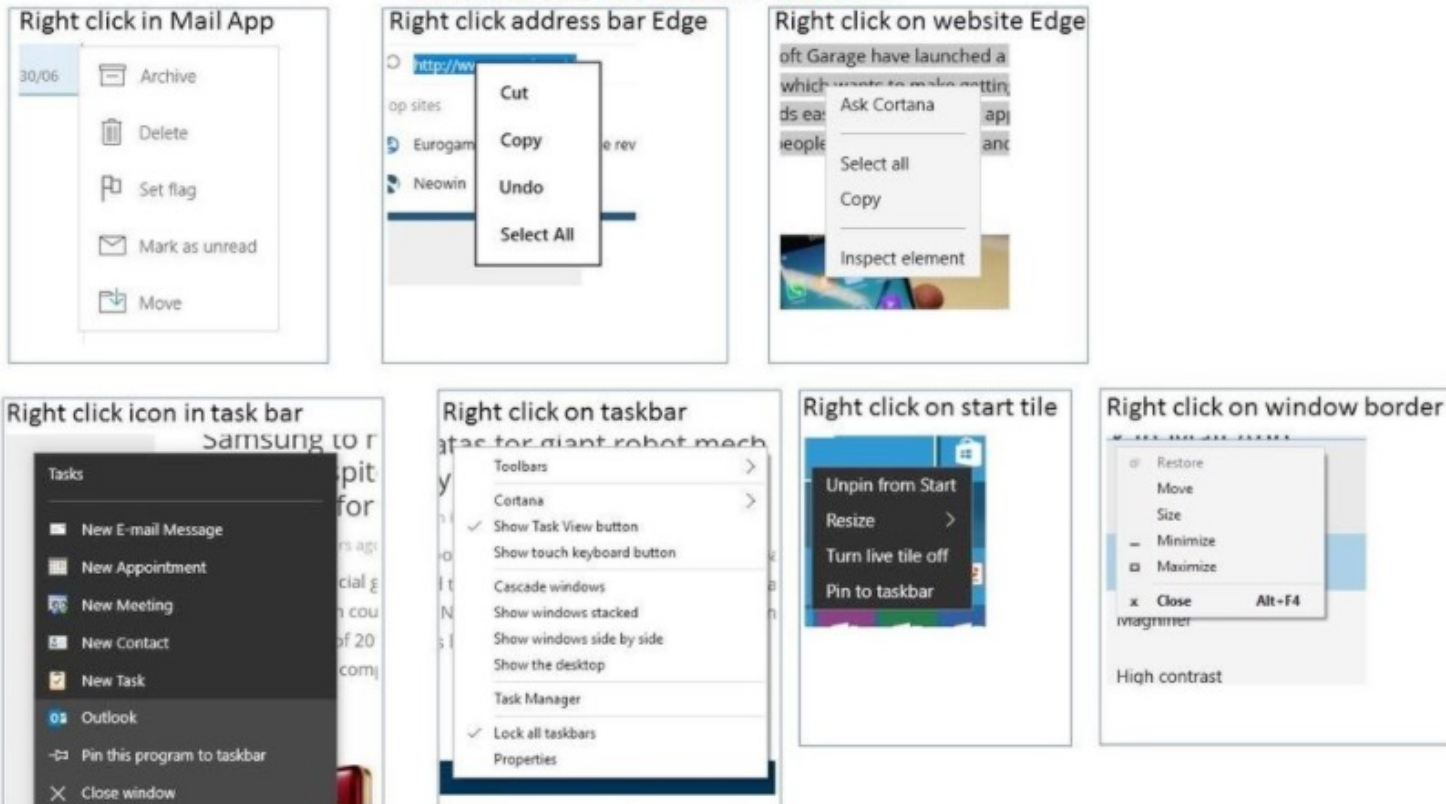

Image source [Twitter](#)

Mapping

A relationship between controls and their movements or effects. Good mapping between controls and their effects results in greater ease of use. – *Universal Principles of Design*

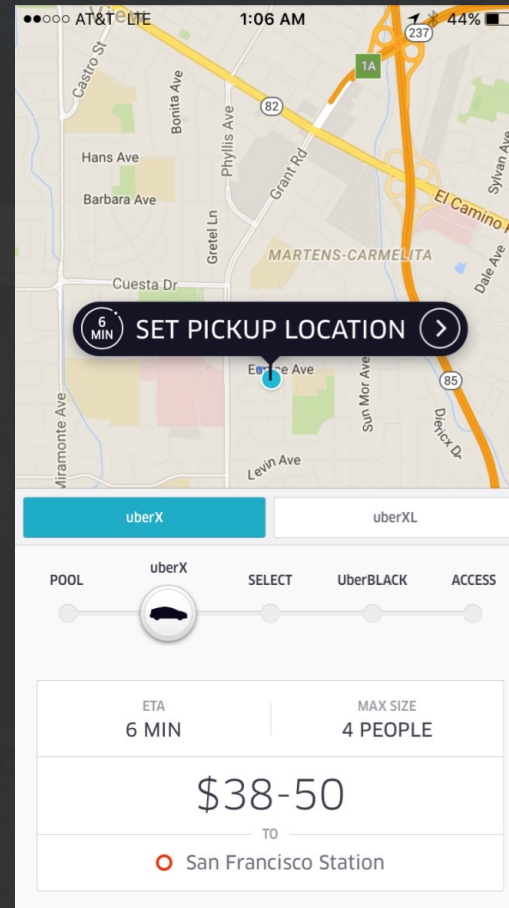

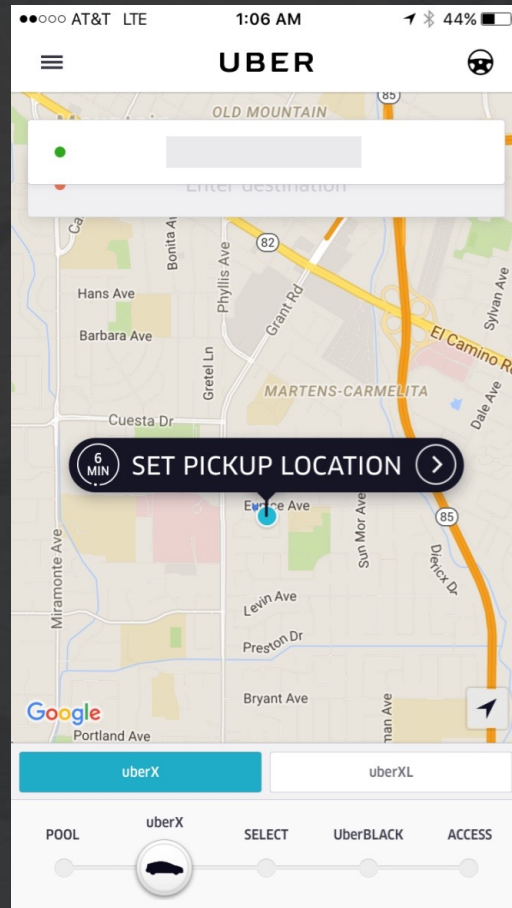

Mapping – which knob goes to each burner?

Mapping – better knob & burner mapping

Progressive disclosure

Visual Hierarchy and Reading Order

Strong visual hierarchies guide visual & logical progression by showing what is important.

Weak visual hierarchies provide little or no guidance about what is important.

5 ways to organize information (five hat racks)

- category
- time
- location
- continuum
- alphabet

The fallback order is alphabetical order

Source: *Universal Principles of Design*

Combining it all

What to consider

- Timeline of use
- Implicit interactions
- Basics
 - 80/20
 - consistency
 - mapping
 - progressive disclosure
 - order
 - hierarchy

Edward Tufte on visualizing information

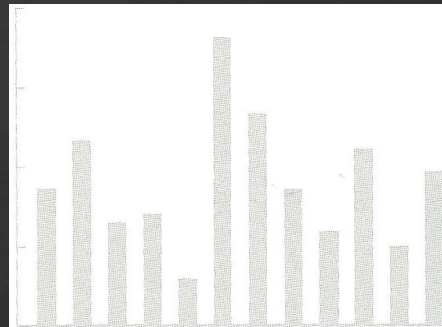

How should I design a bar chart?

Edward Tufte on visualizing information

typical bar chart

erase box

erase vertical axis, except ticks

add white grid to replace tick marks

erase baseline, bottom of bars define endpoint

still, a thin baseline looks good

“This machine is for the aides”: Tailoring Voice Assistant Design to Home Health Care Work

CHI '23, Bartle et al.

Participants also strongly associated control of the IVA software with control of the physical device. In particular, physically opening or closing the device equated to turning it on and off (discussed in detail in Section 5.2.2). Correspondingly, aides felt that “*the aide should choose if it’s open or closed*” (A12). While some participants envisioned the IVA only being accessible when an aide opened its case, others imagined it needing to provide reminders to clients in the absence of an aide. This further led to concerns about clients being able to use the device to access or change their care information (e.g., adding extra tasks not on the approved care plan).
